

900, 900/L, 900/H, 900/L1, 900/H2 CPU Core Different Points

There are 5 type CPU core : ① 900, ② 900/L, ③ 900/H, ④ 900/L1, ⑤ 900/H2 in TLCS-900 series and they are different from following points.

CPU Different	900	900/L	900/H, 900/L1	900/H2
Address Bus	24-bit	←	←	←
Data Bus	16-bit	←	←	32-bit
Instruction Queue	4-byte	←	←	12-byte
Instruction Set	TLCS-900	Deleted instruction NORMAL MAX Added instruction MIN	Deleted instruction NORMAL MAX	Deleted instruction NORMAL MAX LDX
Code Fetch	Only when branch, CPU fetch branch destination code.	←	←	Even when not branch, CPU fetch branch destination code.
Micro DMA	4 channels	←	←	8 channels
Operation Mode	Normal mode, System mode	System mode	←	←
Register Mode	MIN mode, MAX mode, (MIN mode at reset)	MIN mode, MAX mode, (MAX mode at reset)	MAX mode	←
Interrupt	Restart formula	Vector formula	←	←
Normal Stack Pointer (XNSP)	exist	not exist	←	←
Interrupt Nesting Counter (INTNEST)	not exist	exist	←	←

Figure 1 CPU Different Points

1. Outline

The TLCS-900 series has an original Toshiba high-performance 16-bit CPU. Combining the CPU with various I/O function blocks (such as timers, serial I/Os, ADs) creates broad possibilities in application fields.

The TLCS-900 CPU, being 16-bit CPU, has a 32-bit/16-bit register bank configuration, therefore it is suitable as an embedded controller.

The TLCS-900 CPU features are as follows :

(1)TLCS-90 extended architecture

- Upward compatibility on mnemonic and register set levels

(2)General-purpose registers

- All 8 registers usable as accumulator

(3)Register bank system

- four 32-bit register banks

(4)16M-byte linear address space ; 9 types addressing modes

(5)Dynamic bus sizing system

- Can consist 8- / 16-bit external data bus together

(6)High reliability

- Supporting system mode and normal mode (900)
- Supporting only system mode (900/L, 900/H)

(7)Orthogonal instruction sets

- 8-/16-/32-bit data transfer/arithmetic instructions
- 16-bit multiplication/division
 - 16 × 16 to 32-bits (signed/unsigned)
 - 32 ÷ 16 to 16-bits ⋯ remainder 16-bits (signed/unsigned)
- Bit processing including bit arithmetic
- Supporting instruction for C compiler
- Filter calculations : multiplication-addition arithmetic, modulo increment instruction

(8)High-speed processing

- Minimum instruction execution time: 160 ns at 25 MHz

- Pipeline system with 4-byte instruction queue buffer
- 32-bit ALU

2. CPU Operating Modes :

The 900/H has only system mode.

In system mode, there are no restrictions on using instructions or registers.

The CPU resources effective in system mode are as follows :

- 1) General-purpose registers
 - Four 32-bit general-purpose registers × 4 banks
 - Four 32-bit general-purpose registers (including system stack pointer : XSP)
- 2) Status register (SR)
- 3) Program counter (PC): 32 bits
- 4) Control register: parameter register for micro DMA, etc.
- 5) All CPU instructions
- 6) All built-in I/O registers
- 7) All built-in memories

3. Registers

3.1 Register Structure 16M-byte program area / 16M-byte data area

Figure 3.1.1 illustrates the format of registers.

```

Four 32-bit general-purpose registers × 4 banks
+
Four 32-bit general-purpose registers
+
32-bit program counter
+
Status register

```

Register mode changing

The <MAX> bit in status register (SR) is initialized to “1” and set to Maximum mode by resetting. The 900/H has only Maximum mode.

Stack Pointer

The stack pointer (SP) is provided for only System mode (XSP). The System stack pointer (XSP) is set to 100H by resetting.

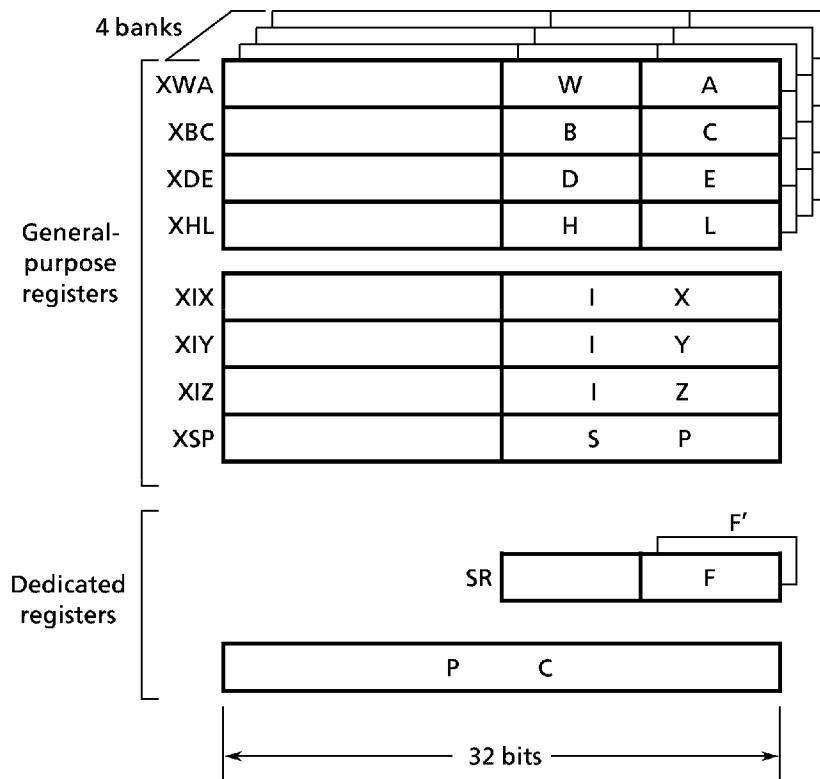

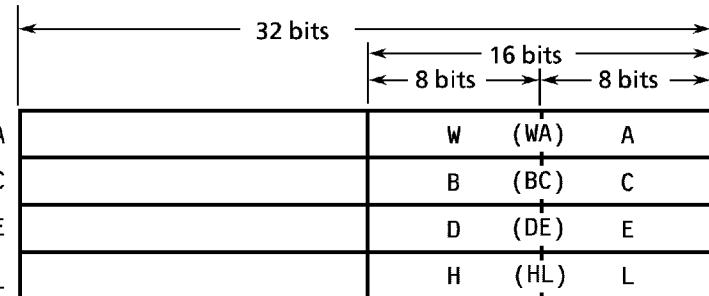

Figure 3.1.1 Register Format (16M-byte program area)

3.2 Register Details

3.2.1 General-purpose bank registers

In maximum mode, the following four 32-bit general-purpose registers consisting of 4 banks can be used. The register format in a bank is shown below.

Four 32-bit registers (XWA, XBC, XDE, and XHL) are general-purpose registers and can be used as accumulators and index registers. They can also be used as 16-bit registers (WA, XHL BC, DE, and HL), in which case, the lower 16 bits of the 32-bit registers are assigned.

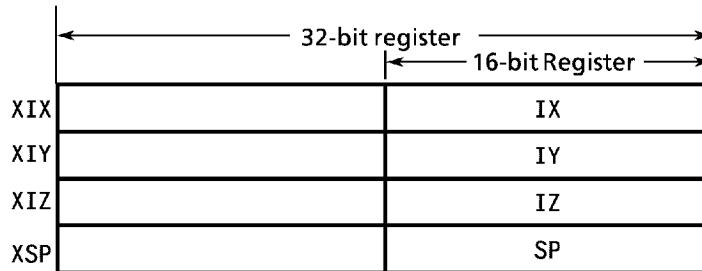

Note: Round brackets () signify 16-bit registers.

16-bit registers can be used as accumulators, index registers in index addressing mode, and displacement registers. They can also be used as two 8-bit general-purpose registers (W, A, B, C, D, E, H, and L) to function for example as accumulators.

3.2.2 32-bit General-purpose Registers

The TLCS-900 series has four 32-bit general-purpose registers (XIX, XIY, XIZ, and XSP). The register format is shown below.

These registers can also be used as accumulators, index registers, and displacement registers. They can be used either as 16-bit, or 8-bit registers. Names when registers are used as 8-bit registers are listed later.

Stack Pointer

The XSP register is utilized for stack pointer. It is used when the interrupt is occurred or "CALL", "RET" instruction are executed. The stack pointer (XSP) is set to 100H by resetting.

3.2.3 Status Register (SR)

The status register contains flags indicating the status (operating mode, register format, etc.) of the CPU and operation results. This register consists of two parts. The upper byte of the status register (bits 8 to 15) indicates the CPU status. The lower byte (bits 0 to 7) are referred to as the flag register (F). This indicates the status of the operation result. The TLCS-900 series has two flag registers (F and F'). They can be switched using the EX instruction.

(1) Upper Byte of Status Register

15	14	13	12	11	10	9	8
SYSM	IFF2	IFF1	IFF0	MAX	RFP2	RFP1	RFP0

① SYSM (SYStem Mode)

Indicates the CPU operating mode, system or normal. 900/H has only system mode.

Initialized to 1 (system mode) by reset.

0	Normal mode
1	System mode (900/H has only this mode.)

② IFF2 to IFF0 (Interrupt mask Flip-Flop2 to 0)

Mask registers with interrupt levels from 1 to 7. Level 7 has the highest priority. Any value can be set using the EI instruction.

Initialized to 111 by reset.

000	Enables interrupts with level 1 or higher.	Same
001	Enables interrupts with level 1 or higher.	
010	Enables interrupts with level 2 or higher.	
011	Enables interrupts with level 3 or higher.	
100	Enables interrupts with level 4 or higher.	
101	Enables interrupts with level 5 or higher.	
110	Enables interrupts with level 6 or higher.	
111	Enables interrupts with level 7 only (non-maskable interrupt).	

When an interrupt is received, the mask register sets a value higher by 1 than the interrupt level received. When an interrupt with level 7 is received, 111 is set. Unlike with the TLCS-90 series, the EI instruction becomes effective immediately after execution.

③ **!MAX (MINimum / MAXimum)**

Bit used to specify the register mode which determines the sizes of the register banks and the program counter.

0	Minimum mode
1	Maximum mode (900/H has only this mode.)

Initialized to “1” (maximum mode) for 900/H by reset. 900/H does not have Minimum mode. Don’t set to “0”.

④ **RFP2 to RFP0 (Register File Pointer2 to 0)**

Indicates the number of register file (register bank) currently being used. Initialized to 000 by reset.

The values in these registers can be operated on using the following three instructions. RFP2 is fixed to 0 in maximum mode. It remains 0 even if an attempt to change it to 1 using following instructions.

- LDF imm ; RFP \leftarrow imm (0 to 3) (160 ns at 25 MHz)
- INC F ; RFP \leftarrow RFP + 1 (160 ns at 25 MHz)
- DECF ; RFP \leftarrow RFP - 1 (160 ns at 25 MHz)

(2) **Flag Register, F**

7	6	5	4	3	2	1	0	: R/W
S	Z	“0”	H	“0”	V	N	C	

① **S (Sign flag)**

“1” is set when the operation result is negative, “0” when positive.
(The value of the most significant bit of the operation result is copied.)

② **Z (Zero flag)**

“1” is set when the operation result is zero, otherwise “0”.

③ **H (Half carry flag)**

“1” is set when a carry or borrow from bit 3 to bit 4 occurs as a result of the operation, otherwise “0”. With a 32-bit operation instruction, an undefined value is set.

④ V (Parity/over-flow flag)

Indicates either parity or overflow, depending on the operation type.

Parity (P): "0" is set when the number of bits set to 1 is odd, "1" when even.

An undefined value is set with a 32-bit operation instruction.

Overflow (V): "0" is set if no overflow, if overflow "1".

⑤ N (Negative)

ADD/SUB flag

"0" is set after an addition instruction such as ADD is executed, "1" after a subtraction instruction such as SUB.

Used when executing the DAA (decimal addition adjust accumulator) instruction.

⑥ C (Carry flag)

"1" is set when a carry or borrow occurs, otherwise "0".

Read and write process of status register

Read from bits 0 to 15	① PUSH SR POP dst
Write to bits 0 to 15	① POP SR
Only bit 15 <SYSM>	"1" is always set, because 900/H CPU has only system mode.
Only bits 14 to 12 <IFF2 to 0>	① EI num A value of "num" is written.
Only bit 11 <MAX>	"1" is always set, because 900/H CPU has only maximum mode.
Only bits 10 to 8 <RFP2 to 0>	① LDF imm ② INCF ③ DECF
Only bits 7 to 0	① PUSH F/POP F ② EX F, F' ③ A flag is set indirectly by executing arithmetic instructions etc.

3.2.4 Program Counter (PC)

The program counter is a pointer indicating the memory address to be executed next.

In maximum mode, the program counter consists of 32 bits. The size of the program area depends on the number of the address pins that the product has. With 24 address pins (A0 to A23), a maximum program area of 16M bytes can be accessed as a linear address space. In this case, the upper 8 bits of the program counter (bits 24 to 31) are ignored.

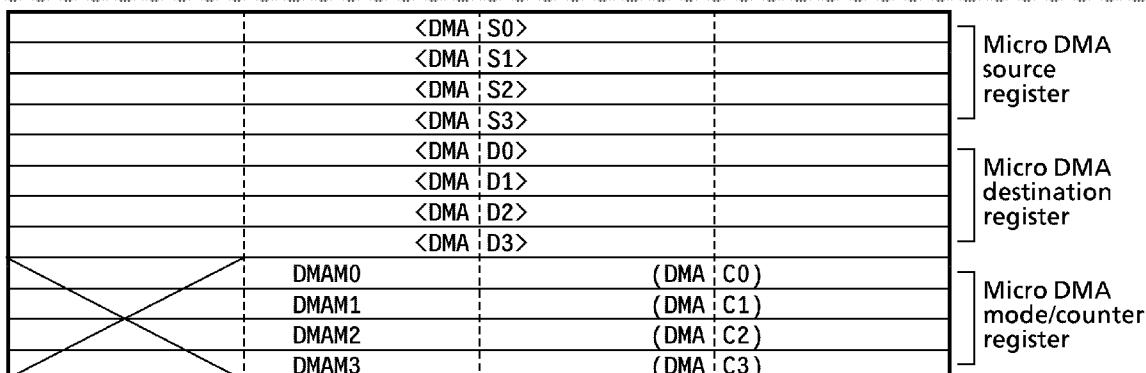

PC after reset

The 900/H reads a value of a reset vector from a vector base address by reset and sets the value into a program counter. Then, program after the vector specified by the program counter are executed.

3.2.5 Control registers (CR)

The control registers consist of registers used to control micro DMA operation and an interrupt nesting counter. Control registers can be accessed by using the LDC instruction.

Control registers are illustrated below.

(INTN | EST)

() : Word register name (16 bits)
< > : Long word register name (32 bits)

Interrupt Nesting Counter

For micro DMA, refer to "Chapter 4 TLCS-900/H LSI Devices".

3.3 Register Bank Switching

Register banks are classified into the following three types.

- Current bank registers
- Previous bank registers
- Absolute bank registers

The current bank is indicated by the register file pointer, <RFP>, (status register bits 8 to 10). The registers in the current bank are used as general-purpose registers, as described in the previous section. By changing the contents of the <RFP>, another register bank becomes the current register bank.

The previous bank is indicated by the value obtained by subtracting 1 from the <RFP>. For example, if the current bank is bank 3, bank 2 is the previous bank. The names of registers in the previous bank are indicated with a dash (WA', BC', DE', HL'). The EX instruction (EX A,A') is used to switch between current and previous banks.

All bank registers, including the current and previous ones, have a numerical value (absolute bank number) to indicate the bank. With a register name which includes a numerical value such as RW0, RA0, etc., all bank registers can be used. These registers (that is, all registers) are called absolute bank registers.

The TLCS-900 series CPU is designed to perform optimally when the current bank registers are operated as the working registers. In other words, if the CPU uses other bank registers, its performance degrades somewhat. In order to obtain maximum CPU efficiency, the TLCS-900 series has a function which easily switches register banks.

The bank switching function provides the following advantages:

- Optimum CPU operating efficiency
- Reduced programming size (Object codes)
- Higher response speed and reduced programming size when used as a context switch for an interrupt service routine.

Bank switching is performed by the instructions listed below.

LDF imm : Sets the contents of the immediate value in <RFP>. imm: 0 to 3

INCF : Increments <RFP> by 1.

DECF : Decrements <RFP> by 1.

The immediate values used by the LDF instruction are from 0 to 3. If a carry or borrow occurs when the INCF or DECF instruction is executed, it is ignored. The value of the <RFP> rotates. For example, if the INCF instruction is executed with bank 3, the result is bank 0. If the DECF instruction is executed with bank 0, the result is bank 3. Note that careless execution of the INCF or DECF instruction may destroy the contents of the register bank.

- Example of Register Bank Usage

The TLCS-900 series registers are formatted in banks. Banks can be used for processing objectives or interrupt levels. Two examples are given below.

<Example 1> When assigning register banks to interrupt processing routines.

Register bank 0 = Used for the main program and interrupt processing other than that shown below.

Register bank 1 = Used for processing INT0 .

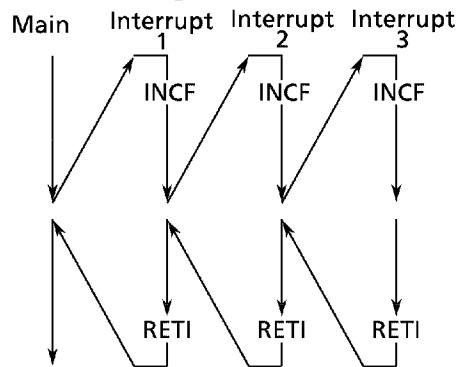

Register bank 2 = Used for processing timer 0.

Register bank 3 = Used for processing timer 1.

For example, if a timer 1 interrupt occurs during main program execution, processing jumps to a subroutine as follows. PUSH/POP processing for the register is unnecessary.

```
LDF 3      ; Sets register bank to 3. 0.16 μs (at 25 MHz)
:
:
RETI      ; Returns to previous status including <RFP>.
          0.96 μs (at 25 MHz)
```

<Example 2> When assigning register banks to their appropriate interrupt level nesting.

Note 1 : In the above example, when interrupt nesting exceeds the number of register banks (4), the <RFP> becomes 000 and the contents of register bank 0 are destroyed.

Note 2 : The INCF instruction is used to execute <RFP>←<RFP> + 1.
0.16 μs (at 25 MHz)

3.4 Accessing General-purpose Registers

The register access code is formatted in a varied code length on byte basis. The current bank registers can be accessed by the shortest code length. All general-purpose registers can be accessed by an instruction code which is 1 byte longer. General-purpose registers are as follows.

① General-purpose registers in current bank

QW	(Q WA)	QA	<X WA >	W	(W A)	A
QB	(Q BC)	QC	<X BC >	B	(B C)	C
QD	(Q DE)	QE	<X DE >	D	(D E)	E
QH	(Q HL)	QL	<X HL >	H	(H L)	L

() : Word register name (16 bits)
 < > : Long word register name (32 bits)

② General-purpose registers in previous bank

QW'	(Q WA')	QA'	<X WA'>	W'	(W A')	A'
QB'	(Q BC')	QC'	<X BC'>	B'	(B C')	C'
QD'	(Q DE')	QE'	<X DE'>	D'	(D E')	E'
QH'	(Q HL')	QL'	<X HL'>	H'	(H L')	L'

③ 32-bit general-purpose registers

QIXH	(Q IX)	QIXL	<X IX>	IXH	(I X)	IXL
QIYH	(Q IY)	QIYL	<X IY>	IYH	(I Y)	IYL
QIZH	(Q IZ)	QIZL	<X IZ>	IZH	(I Z)	IZL
QSPH	(Q SP)	QSPL	<X SP>	SPH	(S P)	SPL

④ Absolute bank registers

QW0	(QWA 0)	QA0	<XWA 0>	RW0	(RWA 0)	RA0	
QB0	(QBC 0)	QC0	<XBC 0>	RB0	(RBC 0)	RC0	
QD0	(QDE 0)	QE0	<XDE 0>	RD0	(RDE 0)	RE0	
QH0	(QHL 0)	QL0	<XHL 0>	RH0	(RHL 0)	RL0	
QW1	(QWA 1)	QA1	<XWA 1>	RW1	(RWA 1)	RA1	
QB1	(QBC 1)	QC1	<XBC 1>	RB1	(RBC 1)	RC1	
QD1	(QDE 1)	QE1	<XDE 1>	RD1	(RDE 1)	RE1	
QH1	(QHL 1)	QL1	<XHL 1>	RH1	(RHL 1)	RL1	
QW2	(QWA 2)	QA2	<XWA 2>	RW2	(RWA 2)	RA2	
QB2	(QBC 2)	QC2	<XBC 2>	RB2	(RBC 2)	RC2	
QD2	(QDE 2)	QE2	<XDE 2>	RD2	(RDE 2)	RE2	
QH2	(QHL 2)	QL2	<XHL 2>	RH2	(RHL 2)	RL2	
QW3	(QWA 3)	QA3	<XWA 3>	RW3	(RWA 3)	RA3	
QB3	(QBC 3)	QC3	<XBC 3>	RB3	(RBC 3)	RC3	
QD3	(QDE 3)	QE3	<XDE 3>	RD3	(RDE 3)	RE3	
QH3	(QHL 3)	QL3	<XHL 3>	RH3	(RHL 3)	RL3	

() : Word register name (16 bits)

< > : Long word register name (32 bits)

4. Addressing Modes

The TLCS-900 series has nine addressing modes. These are combined with most instructions to improve CPU processing capabilities.

TLCS-900 series addressing modes are listed below. They cover the entire TLCS-90 addressing modes.

No.	Addressing mode	Description
1.	Register	reg8 reg16 reg32
2.	Immediate	n8 n16 n32
3.	Register indirect	(reg)
4.	Register indirect pre-decrement	(- reg)
5.	Register indirect post-increment	(reg +)
6.	Index	(reg + d8) (reg + d16)
7.	Register index	(reg + reg8) (reg + reg16)
8.	Absolute (Direct addressing mode)	(n8) (n16) (n24)
9.	Relative	(PC + d8) (PC + d16)

reg 8 : All 8-bit registers such as W, A, B, C, D, E, H, L, etc.

reg 16 : All 16-bit registers such as WA, BC, DE, HL, IX, IY, IZ, SP, etc.

reg 32 : All 32-bit registers such as XWA, WBC, XDE, XHL, XIX, XIY, XIZ, XSP, etc.

reg : All 32-bit registers such as XWA, WBC, XDE, XHL, XIX, XIY, XIZ, XSP, etc.

d8 : 8-bit displacement (-80H to +7FH)

d16 : 16-bit displacement (-8000H to +7FFFH)

n8 : 8-bit constant (00H to FFH)

n16 : 16-bit constant (0000H to FFFFH)

n32 : 32-bit constant (00000000H to FFFFFFFFH)

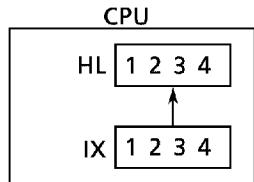

Note: Relative addressing mode can only be used with the following instructions:

LDAR, JR, JRL, DJNZ, and CALR

(1) Register Addressing Mode

In this mode, the operand is the specified register.

Example: LD HL,IX

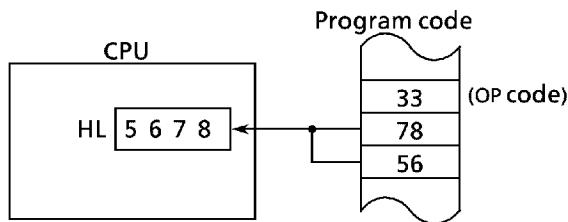

The IX register contents, 1234H, are loaded to the HL register.

(2) Immediate Addressing Mode

In this mode, the operand is in the instruction code.

Example: LD HL,5678H

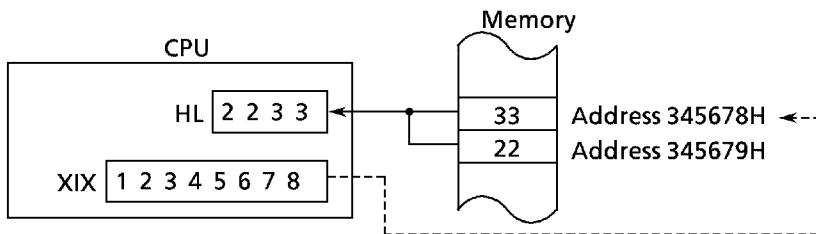

The immediate data, 5678H, is loaded to the HL register.

(3) Register Indirect Addressing Mode

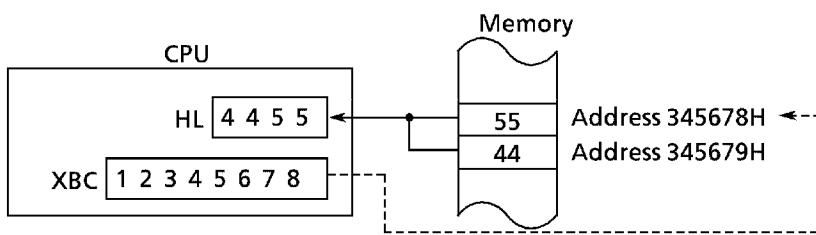

In this mode, the operand is the memory address specified by the contents of the register.

Example 1: LD HL, (XIX)

Memory data, 2233H, at address 345678H is loaded to the HL register.

Example 2: LD HL,(XBC)

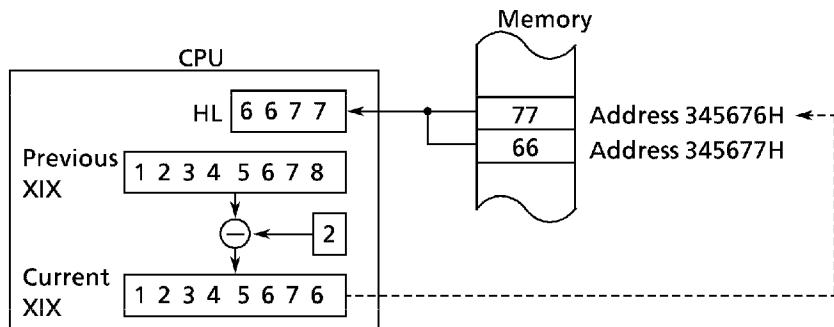

If a bank register (XWA, XBC, XDE, or XHL) is used for addressing, the values of bits 0 to 23 are output to the address bus.

(4) Register Indirect Pre-decrement Addressing Mode

In this mode, the contents of the register is decremented by the pre-decrement values. In this case, the operand is the memory address specified by the decremented register.

Example 1: LD HL, (-XIX)

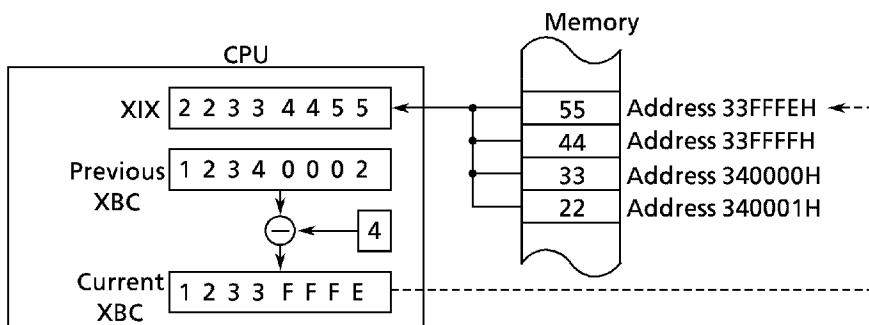

The pre-decrement values are as follows:

When the size of the operand is one byte (8 bits) : -1

When the size of the operand is one word (16 bits) : -2

When the size of the operand is one long word (32 bits) : -4

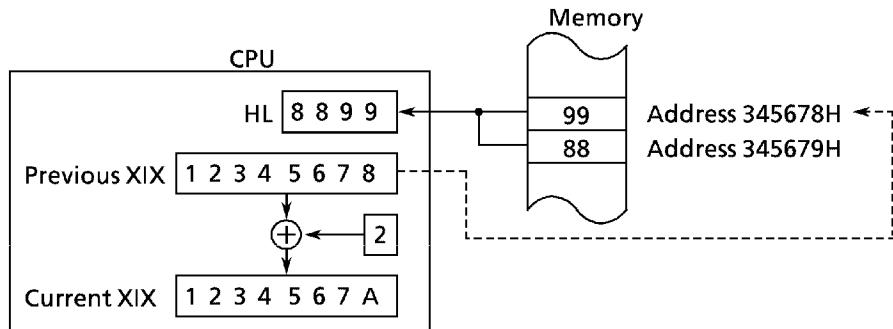

Example 2: LD XIX,(-XBC)

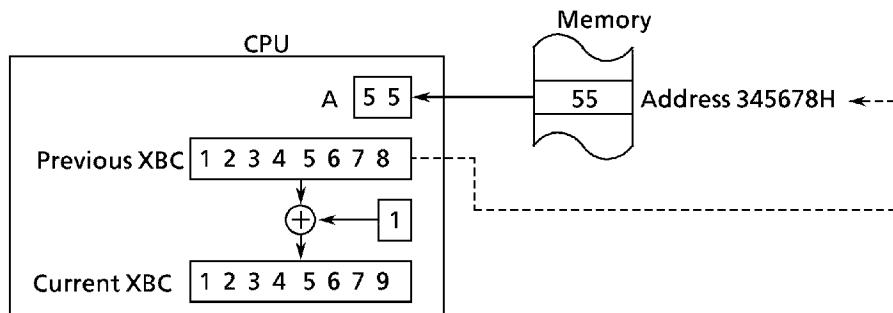

(5) Register Indirect Post-increment Addressing Mode

In this mode, the operand is the memory address specified by the contents of the register. After the operation, the contents of the register are incremented by the size of the operand.

Example 1: LD HL,(XIX +)

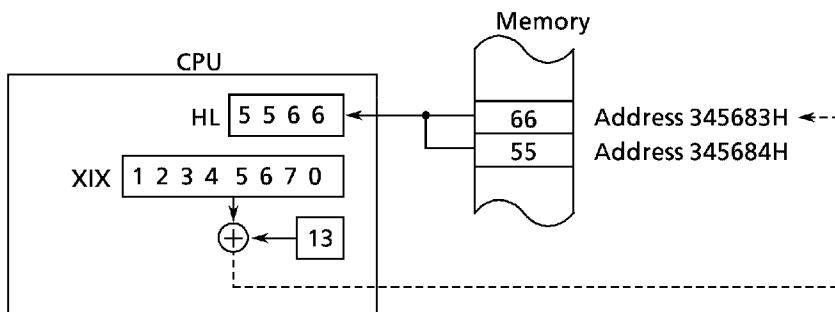

Example 2: LD A,(XBC +)

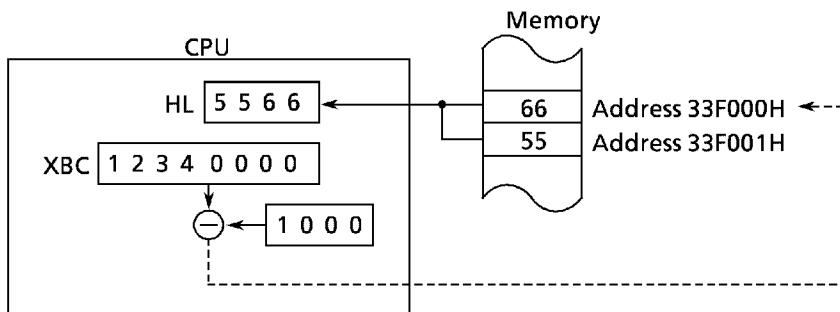

(6) Index Addressing Mode

In this mode, the operand is the memory address obtained by adding the contents of the specified register to the 8- or 16-bit displacement value in the instruction code.

Example 1: LD HL,(XIX + 13H)

Example 2: LD HL,(XBC-1000H)

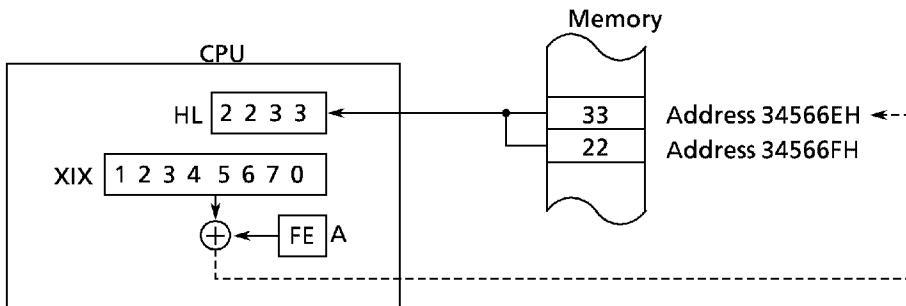

The displacement values range from $-8000H$ to $+7FFFH$.

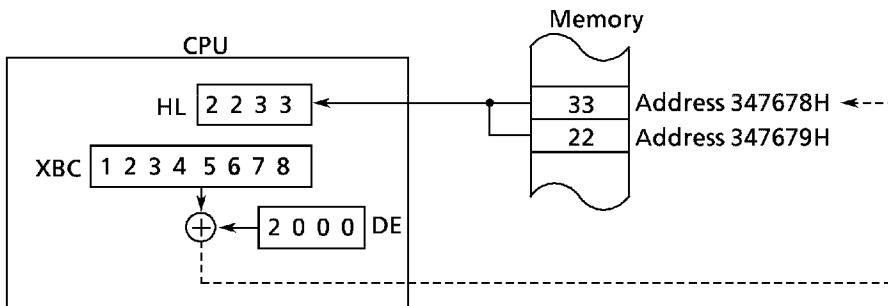

(7) Register Index Addressing Mode

The operand is the memory address obtained by adding the contents of the register specified to the base and the register specified to the displacement (signed 8- or 16-bit integer).

Example 1: LD HL,(XIX + A)

Example 2: LD HL,(XBC + DE)

The range of displacement is :

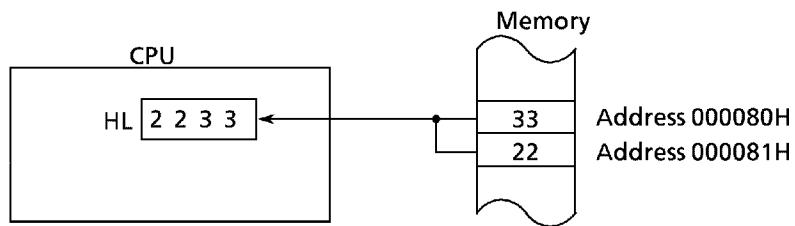

-80H ~ 7FH in case of 8-bit and -8000H ~ +7FFFH in case of 16-bit.

(8) Absolute Addressing Mode

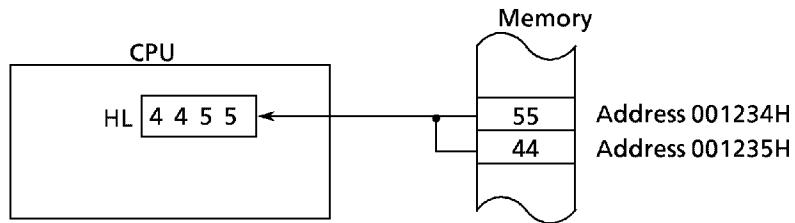

In this mode, the operand is the memory address specified by 1 to 3 bytes in the instruction code. Addresses 000000H to 0000FFH can be specified by 1 byte. Addresses 000000H to 00FFFFH can be specified by 2 bytes. Addresses 000000H to FFFFFFFH can be specified by 3 bytes.

In this mode, addressing to 256-byte area (0H to FFH) which can be specified by 1 byte is called the direct addressing mode. In the direct addressing mode, a program memory area and execution time can be cut down.

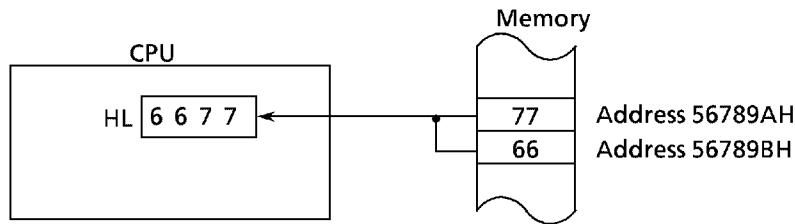

Example 1: LD HL,(80H)

Example 2: LD HL,(1234H)

Example 3: LD HL,(56789AH)

(9) Relative Addressing Mode

In this mode, the operand is the memory address obtained by adding the 8- or 16-bit displacement value to the address where the instruction code being executed is located.

In this mode, only the following five instructions can be used.

LDAR R, \$ + 4 + d16

JR cc, \$+2+d8

JRL cc, \$+3+d16

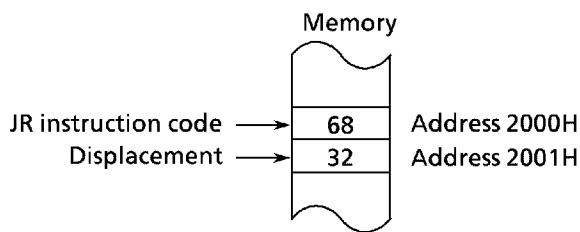

CALR §+3+d16

DJNZ r, \$+3+d8

(\\$: start address of instruction code)

In calculating the displacement object code value, the adjustment value (+2 to +4) depends on the instruction type.

Example 1: JR 2034H

In the above example, the displacement object code value is:

$$2034H - (2000H + 2) = 32H.$$

5. Instructions

In addition to its various addressing modes, the TLCS-900 series also has a powerful instruction set. The basic instructions are classified into the following nine groups:

- Load instructions (8/16/32 bits)
- Exchange instructions (8/16 bits)
- Block transfer and Block search instructions (8/16 bits)
- Arithmetic operation instructions (8/16/32 bits)
- Logical operation instructions (8/16/32 bits)
- Bit operation instructions (1 bit)
- Special operations, CPU control instructions
- Rotate and Shift instructions (8/16/32 bits)
- Jump, Call, and Return instructions

Table 5.1 lists the basic instructions of the TLCS-900 series. For details of instructions, see Appendix A; for the instruction list, Appendix B; for the instruction code map, Appendix C; and for the differences between the TLCS-90 and TLCS-900 series, Appendix D.

Table 5.1 TLCS-900 Series Basic Instructions

LD	dst, src	Load dst \leftarrow src
PUSH	src	Push src data to stack. SP \leftarrow SP - size: (SP) \leftarrow src
POP	dst	Pop data from stack to dst. dst \leftarrow (SP) : SP \leftarrow SP + size
LDA	dst, src	Load address: set src effective address in dst.
LDAR	dst, PC + dd	Load address relative: set program counter relative address value in dst. dst \leftarrow PC + dd
EX	dst1, dst2	Exchange dst1 and dst2 data.
MIRR	dst	Mirror-invert dst bit pattern.
LDI		Load increment
LDIR		Load increment repeat
LDD		Load decrement
LDDR		Load decrement repeat
CPI		Compare increment
CPIR		Compare increment repeat
CPD		Compare decrement
CPDR		Compare decrement repeat
ADD	dst, src	Add dst \leftarrow dst + src
ADC	dst, src	Add with carry dst \leftarrow dst + src + CY
SUB	dst, src	Subtract dst \leftarrow dst - src
SBC	dst, src	Subtract with carry dst \leftarrow dst - src - CY
CP	dst, src	Compare dst - src
AND	dst, src	And dst \leftarrow dst AND src
OR	dst, src	Or dst \leftarrow dst OR src
XOR	dst, src	Exclusive-or dst \leftarrow dst XOR src
INC	imm, dst	Increment dst \leftarrow dst + imm
DEC	imm, dst	Decrement dst \leftarrow dst - imm
MUL	dst, src	Multiply unsigned dst \leftarrow dst (low) \times src
MULS	dst, src	Multiply signed dst \leftarrow dst (low) \times src
DIV	dst, src	Divide unsigned dst (low) \leftarrow dst \div src dst (high) \leftarrow remainder V flag set due to division by 0 or overflow.
DIVS	dst, src	Divide signed dst (low) \leftarrow dst \div src dst (high) \leftarrow remainder: sign is same as that of dividend. V flag set due to division by 0 or overflow.

MULA	dst	Multiply and add $\frac{\text{dst} \leftarrow \text{dst} + (\text{XDE}) \times (\text{XHL}-)}{32\text{bits} \quad 32\text{bits} \quad 16\text{bits} \quad 16\text{bits}}$
MINC1	num, dst	Modulo increment 1
MINC2	num, dst	Modulo increment 2
MINC4	num, dst	Modulo increment 4
MDEC1	num, dst	Modulo decrement 1
MDEC2	num, dst	Modulo decrement 2
MDEC4	num, dst	Modulo decrement 4
NEG	dst	Negate $\text{dst} \leftarrow 0 - \text{dst}$ (Twos complement)
CPL	dst	Complement $\text{dst} \leftarrow \text{not dst}$ (Ones complement)
EXTZ	dst	Extend zero: set upper data of dst to 0.
EXTS	dst	Extend signed: copy the MSB of the lower data of dst to upper data.
DAA	dst	Decimal adjustment accumulator
PAA	dst	Pointer adjustment accumulator: when dst is odd, increment dst by 1 to make it even. if dst (0) = 1 then $\text{dst} \leftarrow \text{dst} + 1$.
LDCF	bit, src	Load carry flag: copy src<bit> value to C flag.
STCF	bit, dst	Store carry flag: copy C flag value to dst<bit>.
ANDCF	bit, src	And carry flag: and src<bit> value and C flag, then load the result to C flag.
ORCF	bit, src	Or carry flag: or src<bit> and C flag, then load result to C flag.
XORCF	bit, src	Exclusive-or carry flag: exclusive-or src<bit> value and C flag, then load result to C flag.
RCF		Reset carry flag: reset C flag to 0.
SCF		Set carry flag: set C flag to 1.
CCF		Complement carry flag: invert C flag value.
ZCF		Zero flag to carry flag: copy inverted value of Z flag to C flag.
BIT	bit, src	Bit test: Z flag $\leftarrow \text{not src<bit>}$
RES	bit, dst	Bit reset $\text{dst}<\text{bit}> \leftarrow 0$
SET	bit, dst	Bit set $\text{dst}<\text{bit}> \leftarrow 1$
CHG	bit, dst	Bit change $\text{dst}<\text{bit}> \leftarrow \text{not dst}<\text{bit}>$
TSET	bit, dst	Bit test and set: Z flag $\leftarrow \text{not dst}<\text{bit}>$ $\text{dst}<\text{bit}> \leftarrow 1$

BS1F	A, dst	Bit search 1 forward: search dst for the first bit set to 1 starting from the LSB, then set the bit number in the A register.
BS1B	A,dst	Bit search 1 backward: search dst for the first bit set to 1 starting from the MSB, then set the bit number in the A register.
NOP		No operation
EI	imm	Enable interrupt. IFF←imm
DI		Disable maskable interrupt. IFF←7
PUSH	SR	Push status registers.
POP	SR	Pop status registers.
SWI	imm	Software interrupt PUSH PC&SR JP FFFF00H + 10H × imm
HALT		Halt CPU.
LDC	CTRL – REG, reg	Load control: copy the register contents to control register of CPU.
LDC	reg, CTRL – REG	Load control: copy the control register contents to register.
LDX	dst, src	Load extract. dst←src
LINK	reg, dd	Link: generate stack frame. PUSH reg LD reg, XSP ADD XSP, dd
UNLK	reg	Unlink: delete stack frame. LD XSP, reg POP reg
LDF	imm	Load register file pointer: specify register bank. RFP←imm
INCF		Increment register file pointer: move to new register bank. RFP←RFP + 1
DECF		Decrement register file pointer: return to previous register bank. RFP←RFP – 1
SCC	cc, dst	Set dst with condition codes. if cc then dst ←1 else dst ←0.

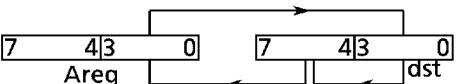

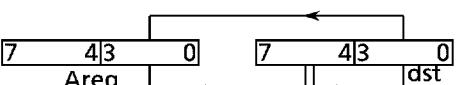

RLC	num, dst	Rotate left without carry	
RRC	num, dst	Rotate right without carry	
RL	num, dst	Rotate left	
RR	num, dst	Rotate right	
SLA	num, dst	Shift left arithmetic	
SRA	num, dst	Shift right arithmetic	
SLL	num, dst	Shift left logical	
SRL	num, dst	Shift right logical	
RLD	dst	Rotate left digit	
RRD	dst	Rotate right digit	
JR	cc, PC + d	Jump relative (8-bit displacement) if cc then PC←PC + d.	
JRL	cc, PC + dd	Jump relative long (16-bit displacement) if cc then PC←PC + dd.	
JP	cc, dst	Jump if cc then PC←dst.	
CALR	RC + dd	Relative call (16-bit displacement) PUSH PC PC←PC + dd.	
CALL	cc, dst	Call relative if cc then PUSH PC PC←dst.	
DJNZ	dst, PC + d	Decrement and jump if non-zero dst←dst - 1 if dst≠ 0 then PC←PC + d.	
RET	cc	Return if cc then POP PC.	
RETD	dd	Return and deallocate RET XSP←XSP + dd	
RETI		Return from interrupt POP SR&PC

← B = Byte (8 bits), W = Word (16 bits), L = Long-Word (32 bits).

* : Indicates instruction added to the TLCS-90 series.

[] : Indicates can be omitted.

6. Data Formats

The TLCS-900 series can handle 1/4/8/16/32-bit data.

(1) Register Data Format

<Data image>

1 bit	
BCD	
Byte	
Word	
Long word	

Note 1 : To access the parts indicated by , the instruction code is one byte longer than when accessing the other parts.

(2) Memory Data Format

<Data image>

1 bit	Address n	
Byte	Address n	
Word	Address n n + 1	
Long word	Address n n + 1 n + 2 n + 3	

Note 2 : There are no restrictions on the location of word or long word data in memory. They can be located from even or odd numbered address.

Note 3 : When the PUSH instruction is used to save data to the stack area, the stack pointer is decremented, then the data is saved.

Example: PUSH HL; XSP←XSP-2
 (XSP) ←L
 (XSP+1) ←H

This is the same in register indirect pre-decrement mode. The order is reversed in the TLCS-90 series: data is saved first, then the stack pointer is decremented.

Example: PUSH HL; (XSP-1) ←H
 (XSP-2) ←L
 XSP←XSP-2

(3) Dynamic Bus Sizing

The TLCS-900 series can switch between 8- and 16-bit data buses dynamically during each bus cycle. This is called dynamic bus sizing. The function enables external memory extension using both 8- and 16-bit data bus memories. Products with a built-in chip select/wait controller can control external data bus size for each address area.

Table 6.1 Dynamic Bus Sizing

Operand data size	Operand start address	Data size at memory side	CPU address	CPU data	
				D15 to D8	D7 to D0
8 bits	2n + 0 (even)	8 bits	2n + 0	xxxxx	b7 to b0
		16 bits	2n + 0	xxxxx	b7 to b0
	2n + 1 (odd)	8 bits	2n + 1	xxxxx	b7 to b0
		16 bits	2n + 1	b7 to b0	xxxxx
16 bits	2n + 0 (even)	8 bits	2n + 0	xxxxx	b7 to b0
			2n + 1	xxxxx	b15 to b8
		16 bits	2n + 0	b15 to b8	b7 to b0
	2n + 1 (odd)	8 bits	2n + 1	xxxxx	b7 to b0
			2n + 2	xxxxx	b15 to b8
		16 bits	2n + 1	b7 to b0	xxxxx
			2n + 2	xxxxx	b15 to b8
32 bits	2n + 0 (even)	8 bits	2n + 0	xxxxx	b7 to b0
			2n + 1	xxxxx	b15 to b8
			2n + 2	xxxxx	b23 to b16
			2n + 3	xxxxx	b31 to b24
		16 bits	2n + 0	b15 to b8	b7 to b0
			2n + 2	b31 to b24	b23 to b16
	2n + 1 (odd)	8 bits	2n + 1	xxxxx	b7 to b0
			2n + 2	xxxxx	b15 to b8
			2n + 3	xxxxx	b23 to b16
			2n + 4	xxxxx	b31 to b24
		16 bits	2n + 1	b7 to b0	xxxxx
			2n + 2	b23 to b16	b15 to b8
			2n + 4	xxxxx	b31 to b24

xxxxx : During read, indicates the data input to the bus are ignored. During write, indicates the bus is at high impedance and the write strobe signal is non-active.

(4) Internal Data Bus Format

With the TLCS-900 series, the CPU and the internal memory (built-in ROM or RAM) are connected via a 16-bit internal data bus. The internal memory operates with 0 wait. The CPU and the built-in I/Os are connected using an 8-bit internal data bus. This is because the built-in I/O access speed has little influence on the overall system operation speed.

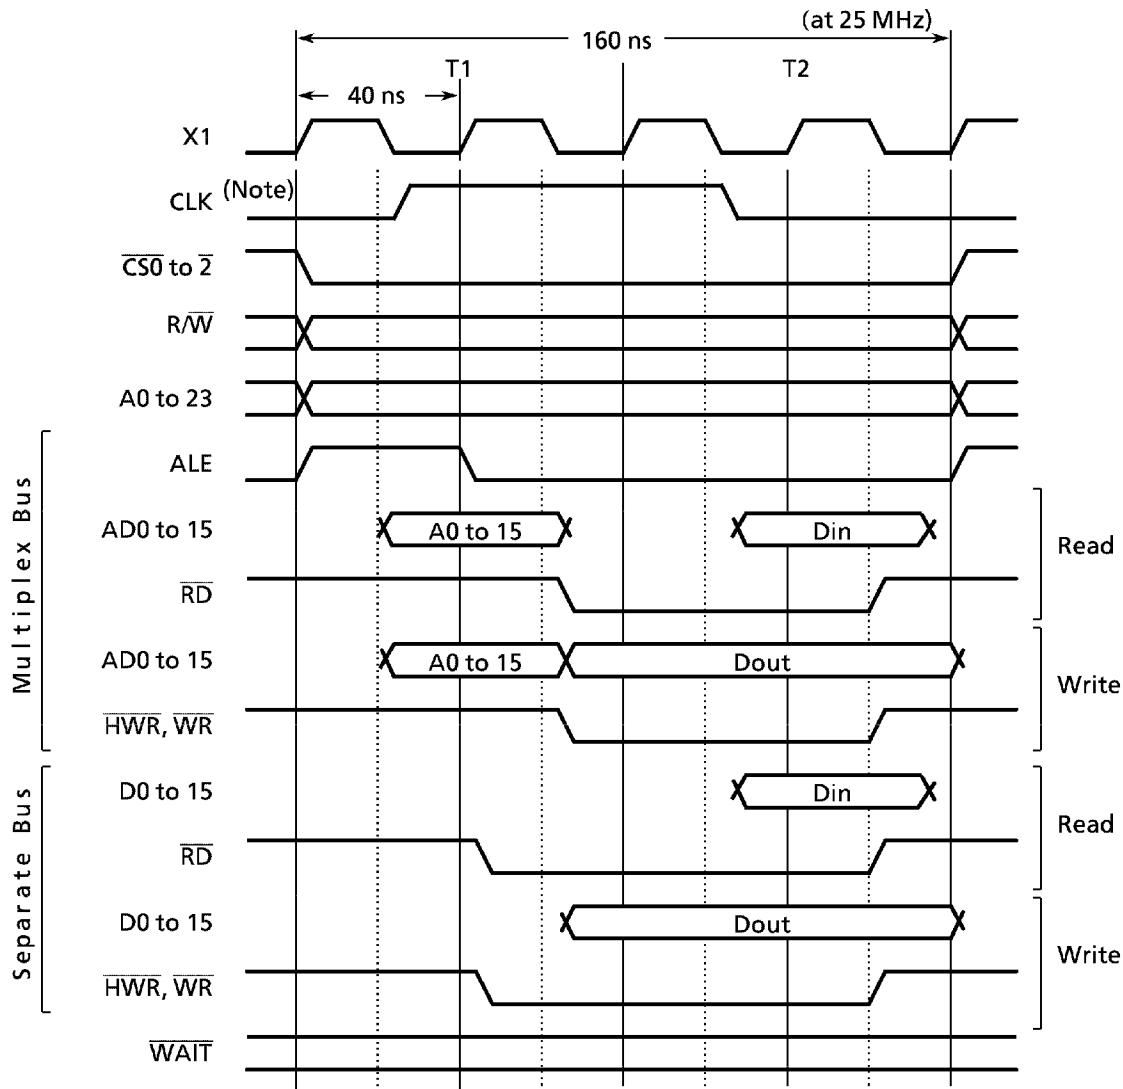

Overall system operation speed depends largely on the speed of program memory access. The built-in I/O operates in sync with the signal phase of the CLK pin. It is synchronized so that the CLK rises () in the middle of the bus cycle. (Figure 7.1 shows signal phases.) If the CLK is “1” when the ALE signal rises, 1 wait is inserted automatically for synchronization.

7. Basic Timings

The TLCS-900 series runs the following basic timings.

- Read cycle
- Write cycle
- Dummy cycle
- Interrupt receive timing
- Reset

Figures 7.1 to 7.10 show the basic timings.

Note : CLK outputs are not always the same as the above phases.

Figure 7.1 0 WAIT Read/Write Cycle

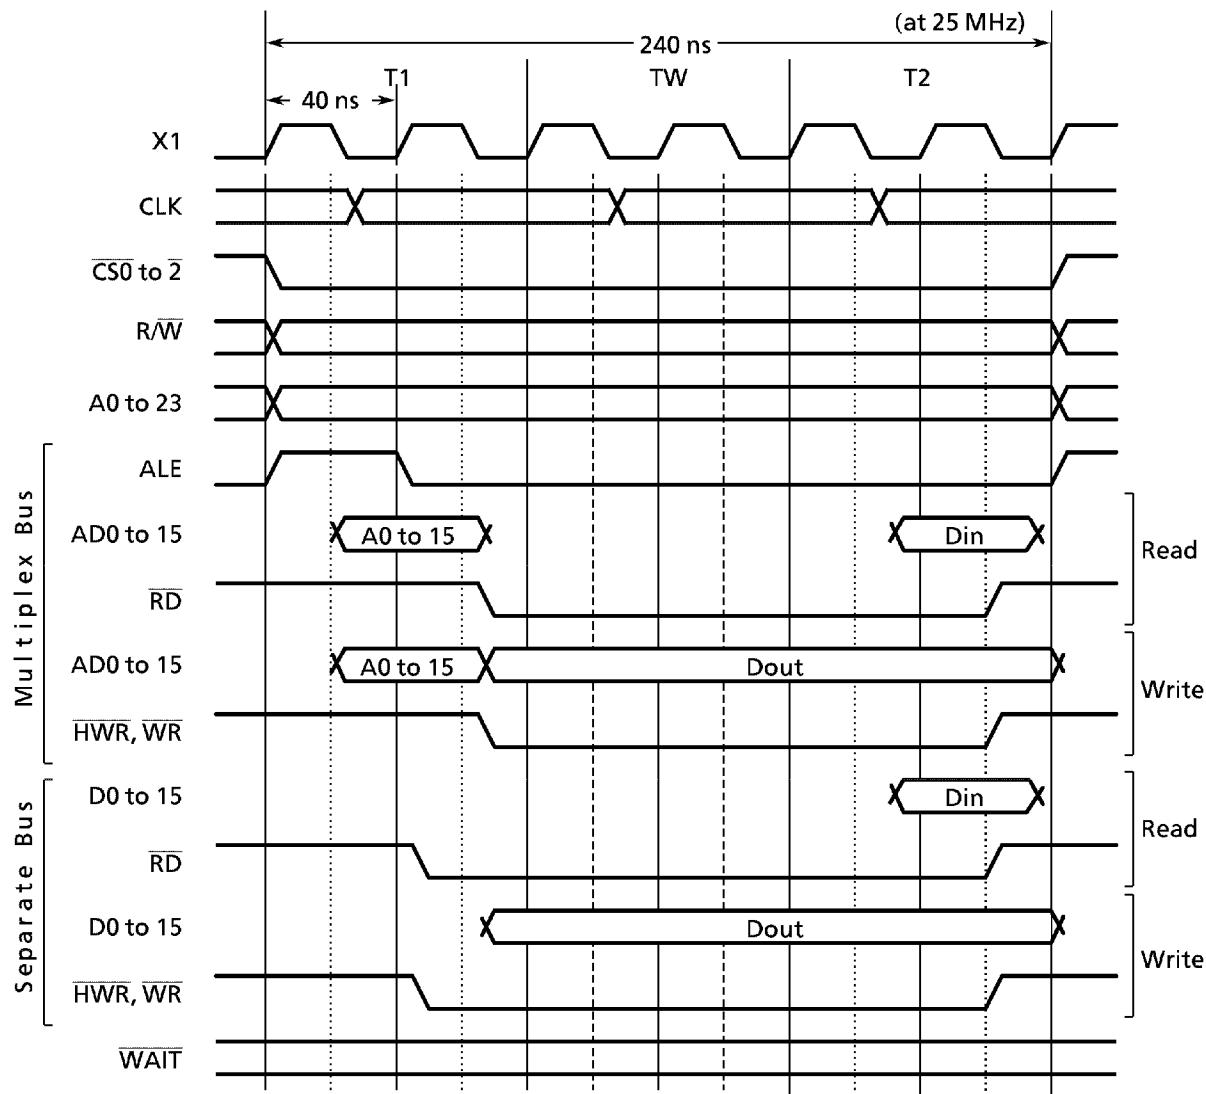

Figure 7.2 1WAIT Read/Write Cycle

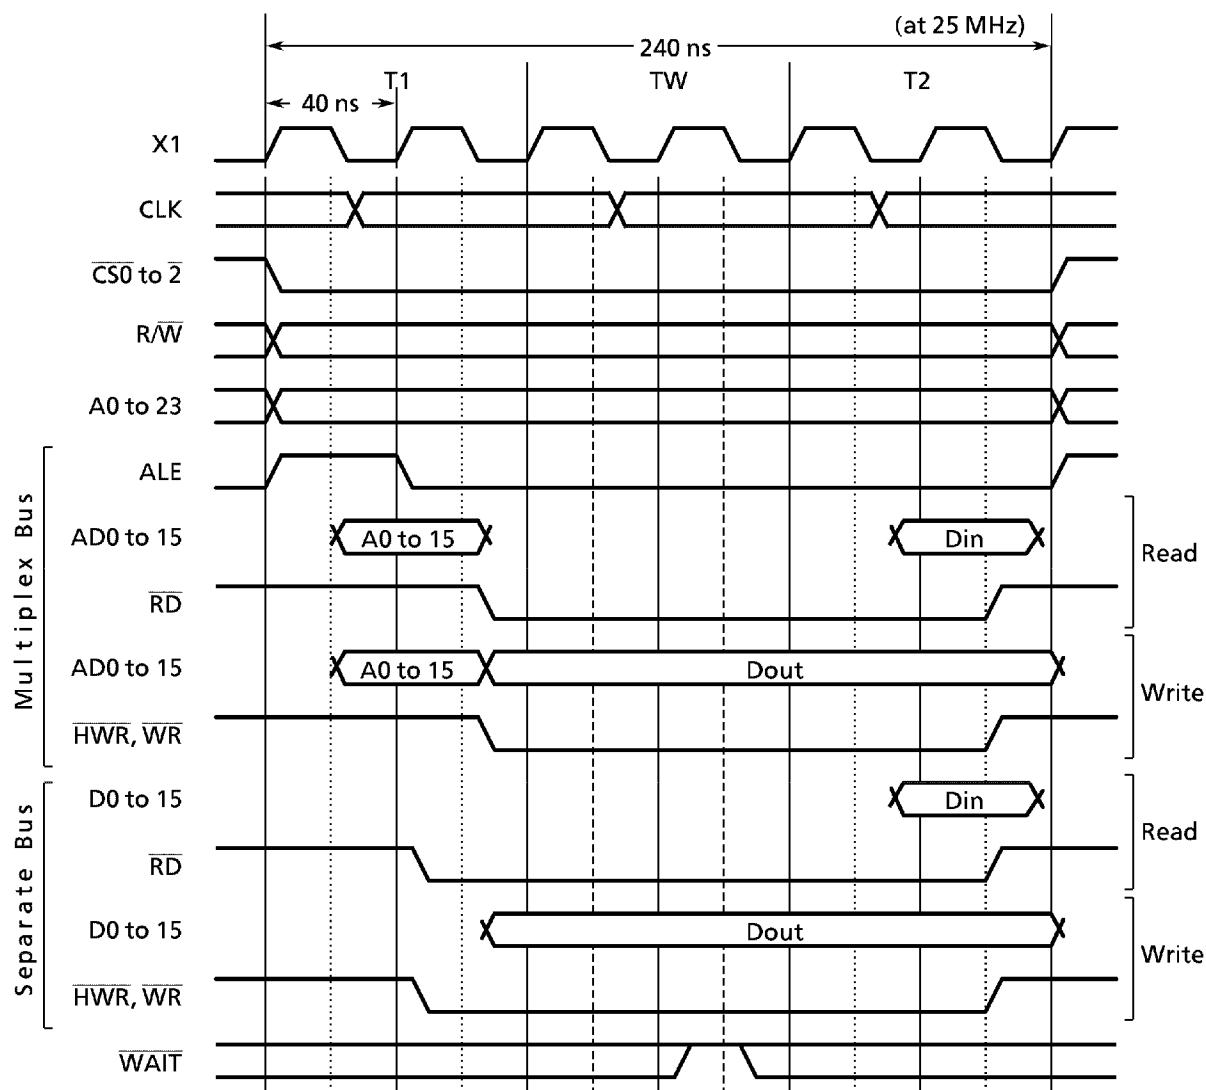

Figure 7.3 1WAIT + n Read/Write Cycle (n = 0)

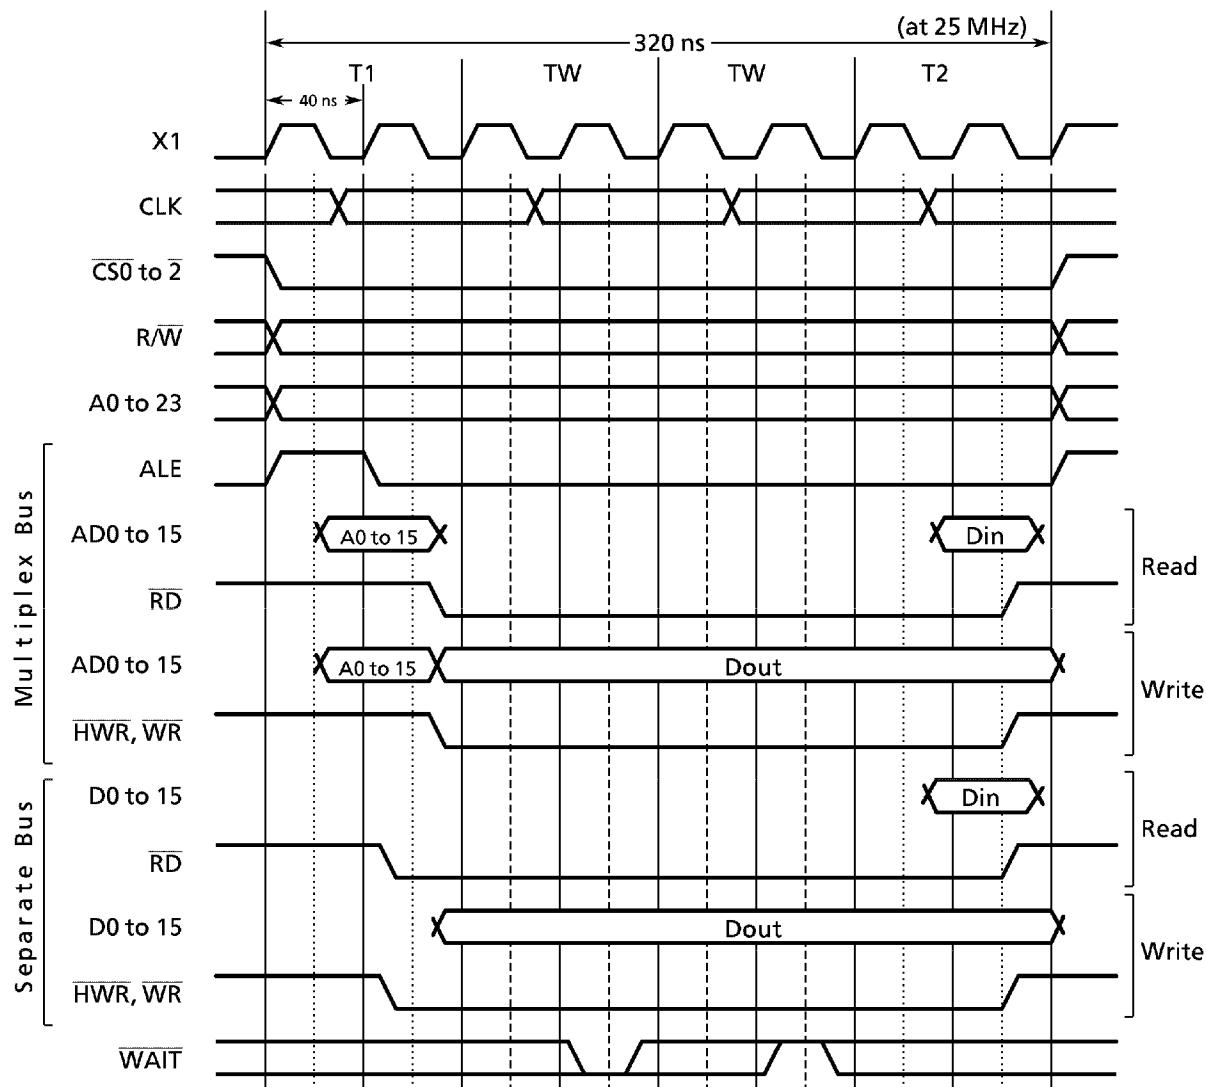

Figure 7.4 1WAIT + n Read/Write Cycle (n = 1)

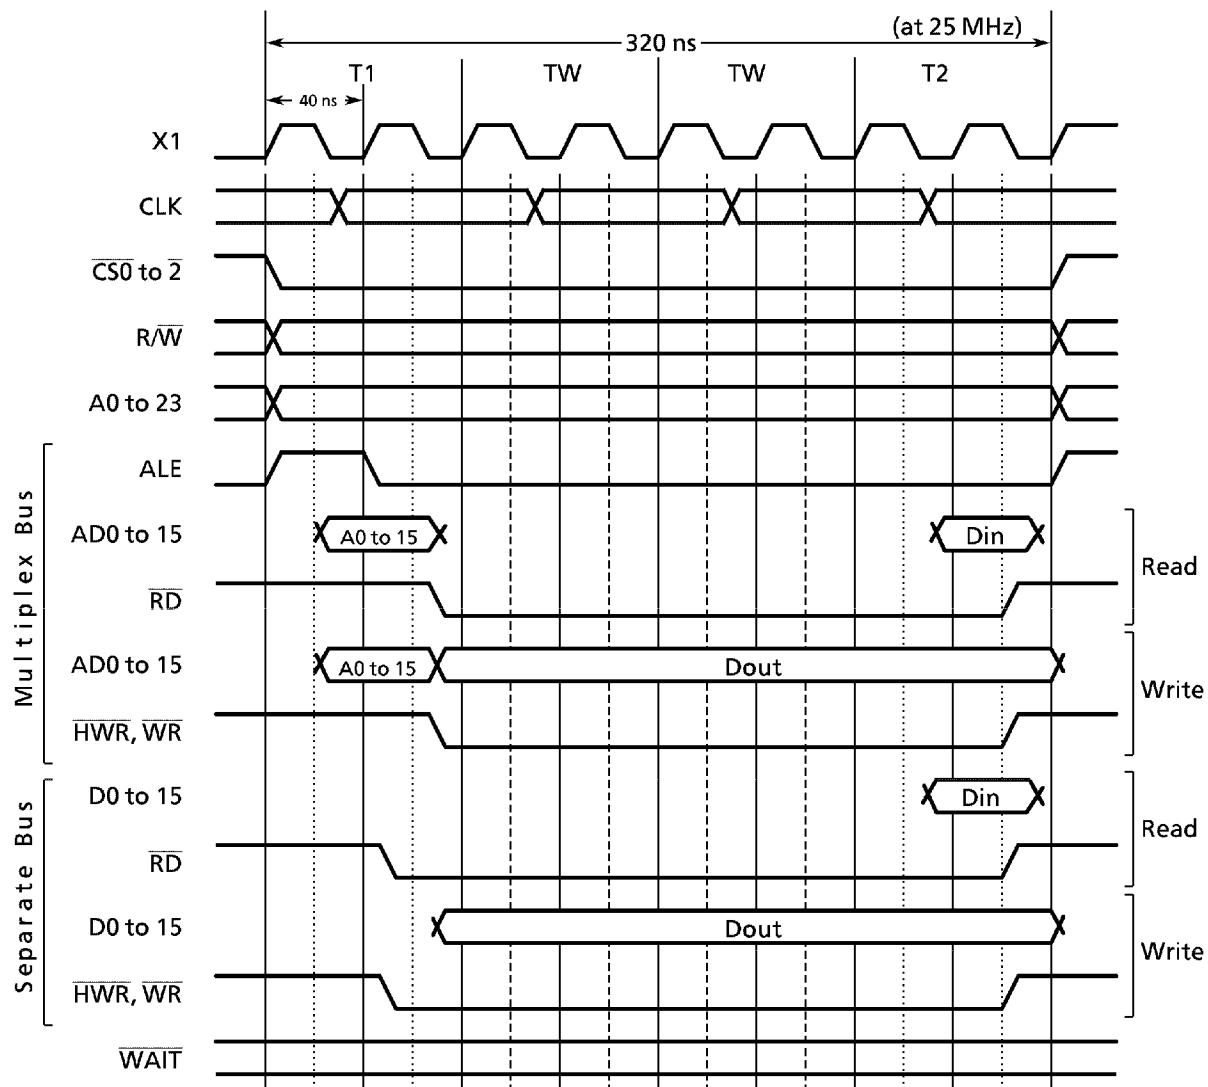

Figure 7.5 2WAIT Read/Write Cycle

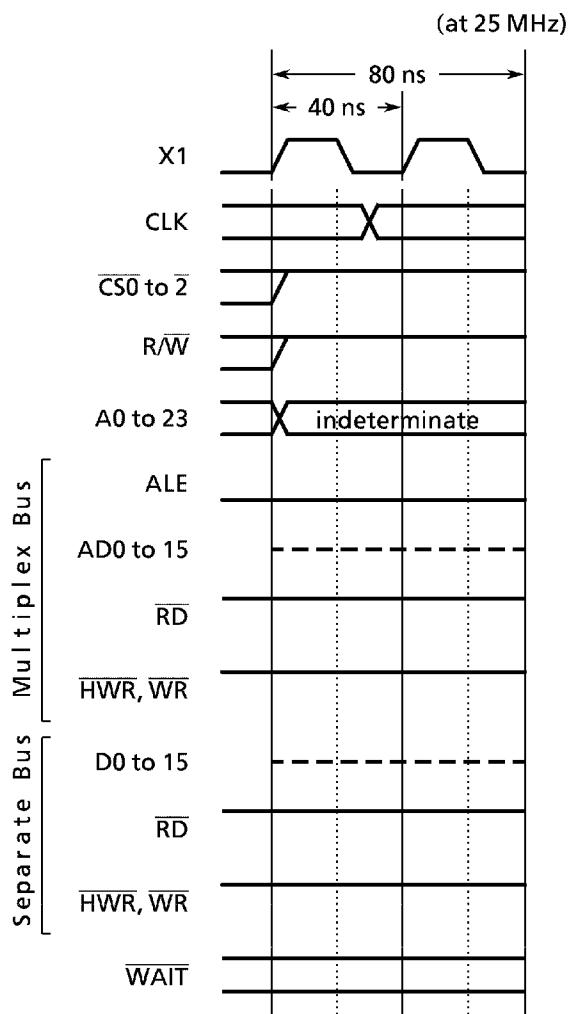

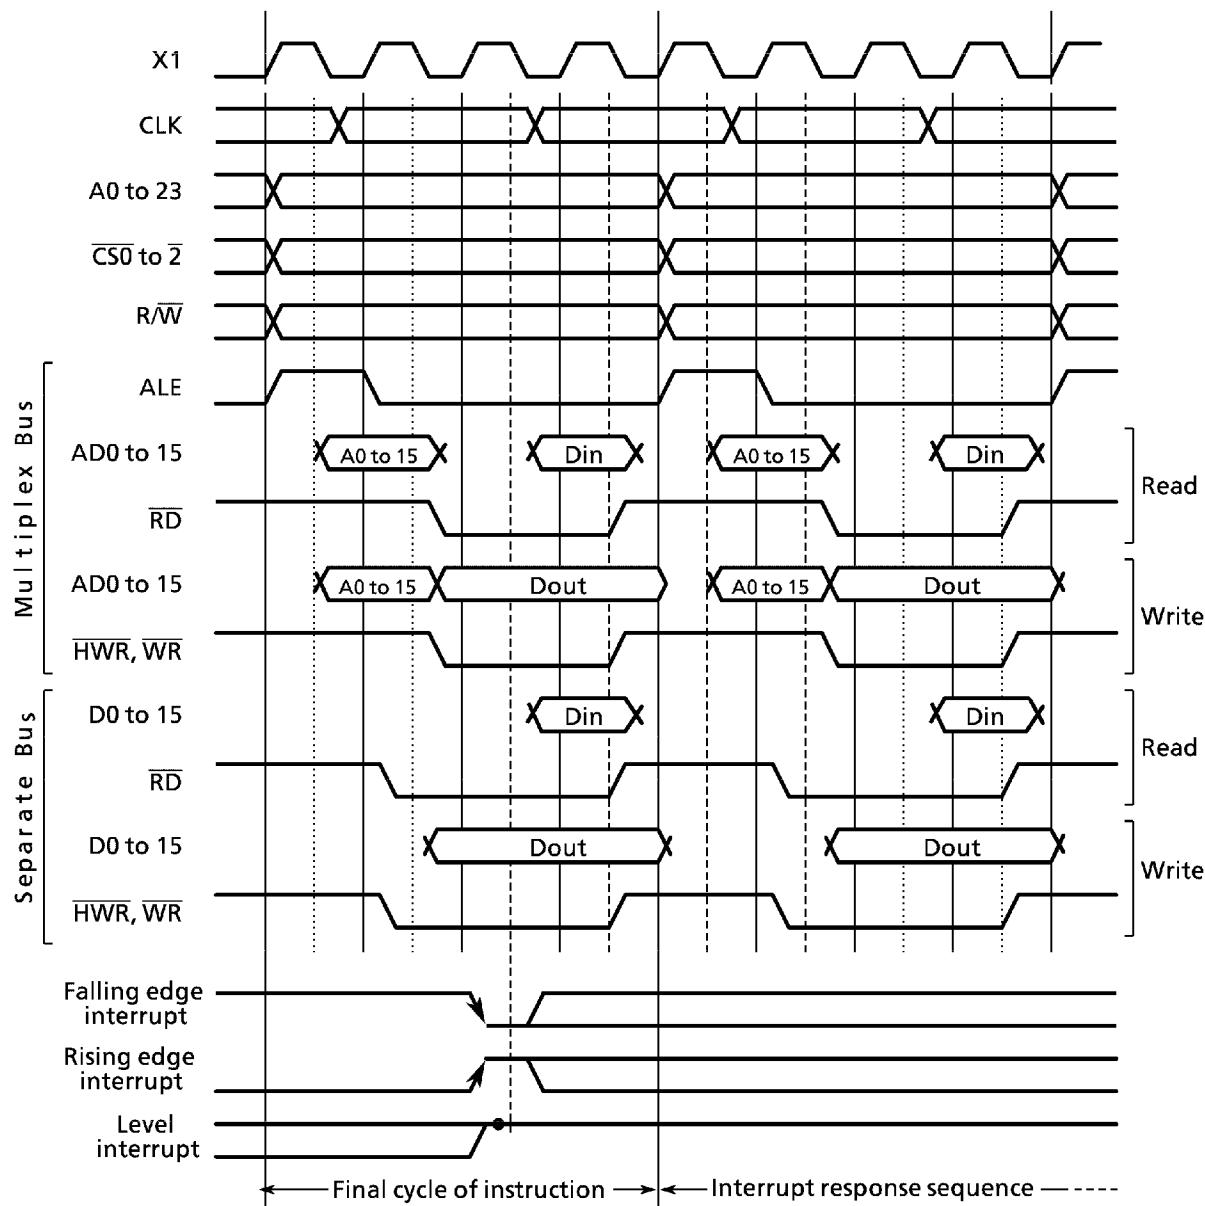

Figure 7.6 1 State Dummy Cycle

Note : This timing chart is a theoretical example. In practice, due to the operation of the bus interface unit in the CPU, external bus and internal interrupt receive timings do not correspond one to one.

Figure 7.7 Interrupt Receive Timing

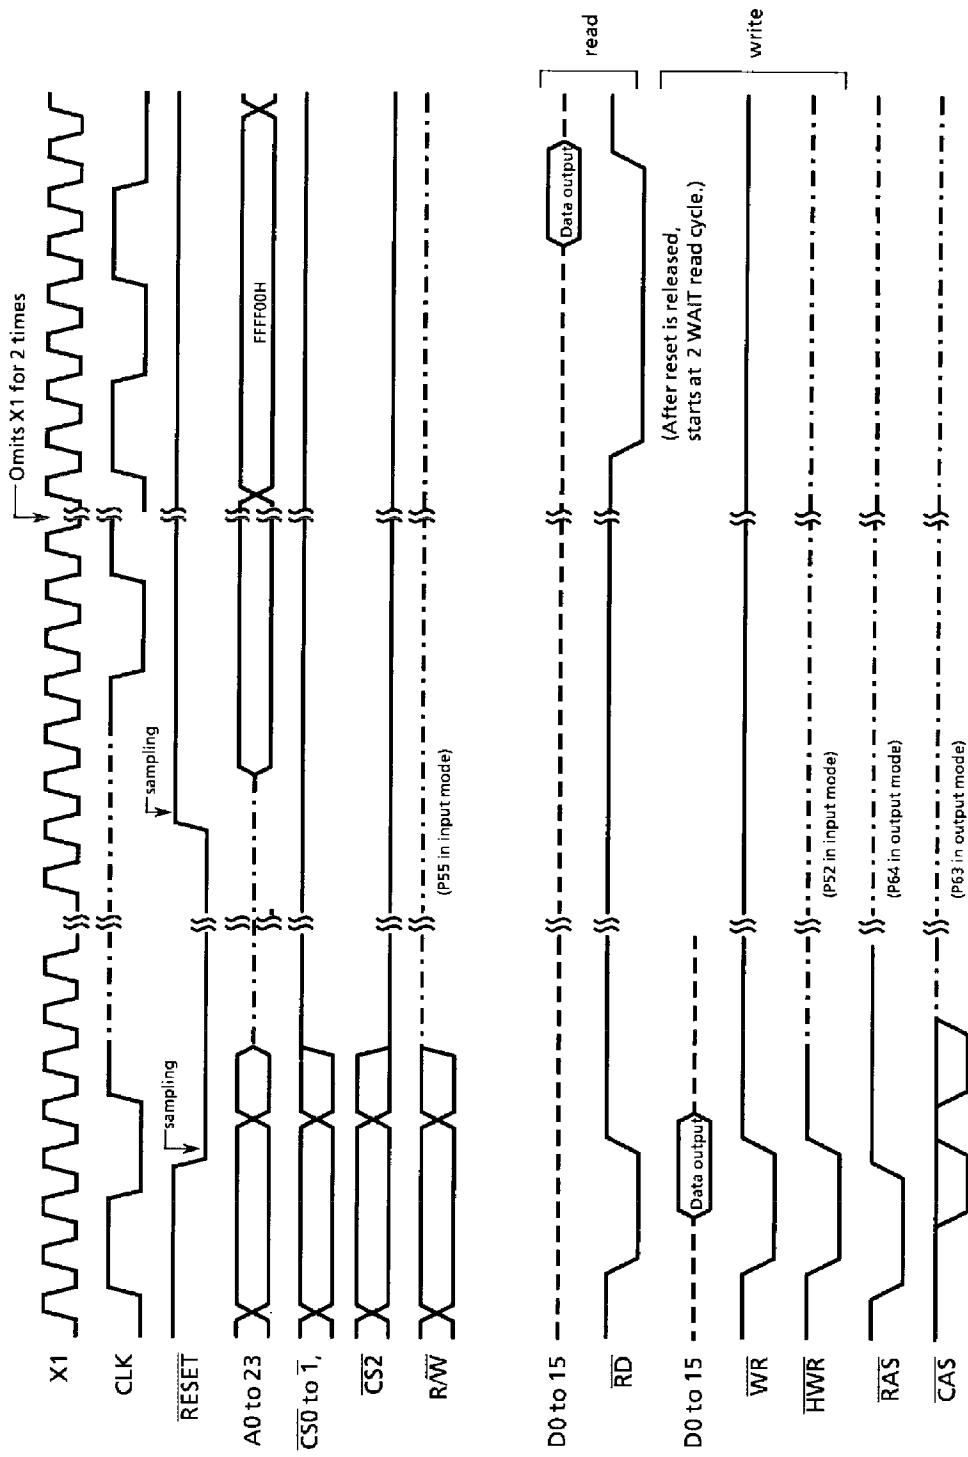

Figure 7.8 Reset Timings (external ROM operation : TMP95C061)

■ Explanations of symbols used in this document

dst	Destination: destination of data transfer or operation result load.
src	Source: source of data transfer or operation data read.
num	Number: numerical value.
condition	Condition: based on flag status.
R	Eight general-purpose registers including 8/16/32-bit current bank registers. 8-bit registers : W, A, B, C, D, E, H, L (only eight registers) 16-bit registers : WA, BC, DE, HL, IX, IY, IZ, SP (only eight registers) 32-bit registers : XWA, XBC, XDE, XHL, XIX, XIY, XIZ, XSP (only eight registers)
r16	8/16/32-bit general-purpose registers
r32	16-bit general-purpose registers 32-bit general-purpose registers } (Please refer to " Register map" on page CPU900H-45, 46.)
cr	All 8/16/32-bit CPU control registers DMAS0 to 3, DMAD0 to 3, DMAC0 to 3, DMAM0 to 3, INTNEST
A	A register (8 bits)
F	Flag registers (8 bits)
F'	Inverse flag registers (8 bits)
SR	Status registers (16 bits)
PC	Program counter (in minimum mode, 16 bits; in maximum mode, 32 bits)
(mem)	8/16/32-bit memory data
mem	Effective address value
<W>	When the operand size is a word, W must be specified.
[]	Operands enclosed in square brackets can be omitted.
#	8/16/32-bit immediate data.
#3	3-bit immediate data : 0 to 7 or 1 to 8 ... for abbreviated codes.
#4	4-bit immediate data : 0 to 15 or 1 to 16
d8	8-bit displacement : -80H to +7FH
d16	16-bit displacement : -8000H to +7FFFH
cc	Condition code
CY	Carry flag
Z	Zero flag
(#8)	Direct addressing: (00H) to (0FFH) ... 256-byte area
(#16)	64K-byte area addressing: (0000H) to (0FFFFH)
(-r32)	Pre-decrement addressing
(r32+)	Post-increment addressing
\$	Start address of instruction

Note: In addition to the above, all registers can be specified by "r" using extension codes. In this case, the number of execution states increases by 1. The format is shown below.

The code value in "r" must be:
 Multiple of 2, if accessed as a word register.
 Multiple of 4 ,if accessed as a long word.
 For registers specified by 8 bits, see Register Maps.

mem	Memory addressing mode specify code				
(XWA)	=	-0--0000

S = MSB value of the result is set.

Z = 1 is set if the result is 0, otherwise 0.

H = 1 is set if a carry from bit 3 to bit 4 occurs as a result of the operation; otherwise, 0. If the operand is 32-bit, an undefined value is set.

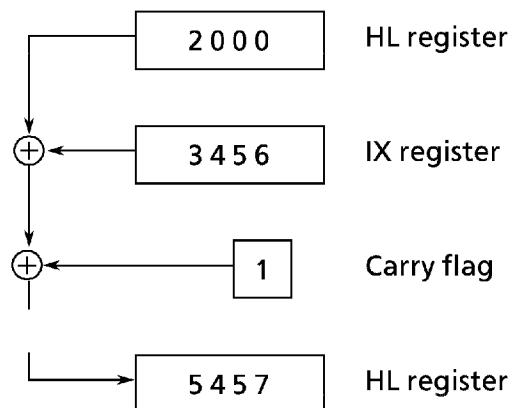

V = 1 is set if an overflow occurs as a result of the operation; otherwise, 0.

N = Cleared to zero.

C = 1 is set if a carry occurs from the MSB, otherwise 0.

Execution example: ADC HL,IX

When the HL register = 2000H, the IX register = 3456H, and the carry flag = 1, execution sets the HL register to 5457H.

ADD dst, src

< Add >

Operation : $dst \leftarrow dst + src$

Description : Adds the contents of dst to those of src and transfers the result to dst.

Details :

x	*	1	x	0	-
---	---	---	---	---	---

S = An undefined value is set.

Z = The inverted value of src<num> is set.

H = 1 is set.

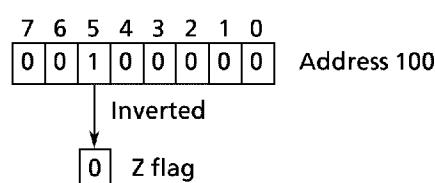

V = An undefined value is set.

N = Reset to 0.

C = No change

Execution example: BIT 5,(100H)

When the contents of memory address 100 = 00100000B (binary), execution sets the Z flag to 0.

BS1B dst, src

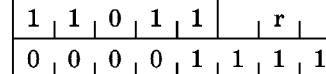

< Bit Search 1 Backward >

Operation : dst \leftarrow src backward searched value

Description : Searches the src bit pattern backward (from MSB to LSB) for the first bit set to 1 and transfers the bit number to dst.

Details :

Byte	Size		Mnemonic	Code
	Word	Long word		
X	O	X	BS1B	A, r

 1 | 1 | 0 | 1 | 1 | | r |
 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1

Note : dst in the operand must be the A register; src must be the register in words. If no bit set to 1 is found in the searched bit pattern, sets the A register to an undefined value and the V flag to 1.

Flags :	S	Z	H	V	N	C
	-	-	-	*	-	-

S = No change

Z = No change

H = No change

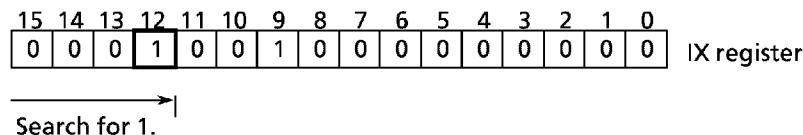

V = 1 is set if the contents of src are all 0s (no bit is set to 1), otherwise 0.

N = No change

C = No change

Execution example: BS1B A,IX

When the IX register = 1200H, execution sets the A register to 0CH.

BS1F dst, src

< Bit Search 1 Forward >

Operation : $dst \leftarrow src$ forward searched result

Description : Searches the src bit pattern forward (from LSB to MSB) for the first bit set to 1 and transfers the bit number to dst.

Details :

Byte	Size		Mnemonic	Code
	Word	Long word		
X	O	X	BS1F	A, r

1 | 1 | 0 | 1 | 1 | | r |
 0 | 0 | 0 | 0 | 1 | 1 | 1 | 0

Note : dst in the operand must be the A register; src must be a register in words.

If no bit set to 1 is found in the searched bit pattern, sets the A register to an undefined value and the V flag to 1.

Flags : S Z H V N C

-	-	-	*	-	-
---	---	---	---	---	---

S = No change

Z = No change

H = No change

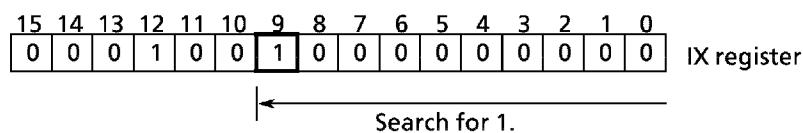

V = 1 is set if the contents of src are all 0s (no bit is set to 1), otherwise 0.

N = No change

C = No change

Execution example: BS1F A,IX

When the IX register = 1200H, execution sets the A register to 09H.

CALL condition, dst

< Call subroutine >

Operation : If cc is true, then XSP \leftarrow XSP - 4, (XSP) \leftarrow 32-bit PC, PC \leftarrow dst.

Description : If the operand condition is true, saves the contents of the program counter to the stack area and jumps to the program address specified by dst.

Details :

Mnemonic	Code																																
CALL #16	<table border="1"> <tr><td>0</td><td>0</td><td>0</td><td>1</td><td>1</td><td>1</td><td>0</td><td>0</td></tr> <tr><td colspan="8">#<7:0></td></tr> <tr><td colspan="8">#<15:8></td></tr> </table>	0	0	0	1	1	1	0	0	#<7:0>								#<15:8>

				1 m z z m m m m 1 1 1 1 1 R
○	○	×	CP<W>	(mem), #
				1 m 0 z m m m m 0 0 1 1 1 1 1 1 #<7:0> #<15:8>

Note : #3 in operands indicates from 0 to 7.

Flags : S Z H V N C

*	*	*	*	1	*
---	---	---	---	---	---

S = MSB value of the result is set.

Z = 1 is set if the result is 0, otherwise 0.

H = 1 is set if a borrow from bit 3 to bit 4 occurs as a result of the operation, otherwise 0. If the operand is 32 bits, an undefined value is set.

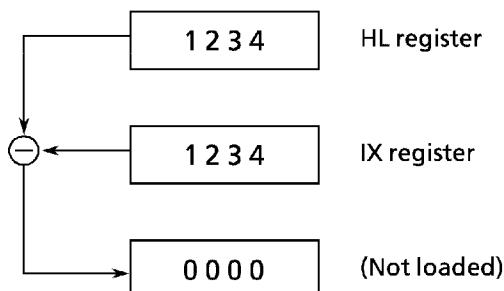

V = 1 is set if an overflow occurs as a result of the operation, otherwise 0.

N = 1 is set.

C = 1 is set if a borrow occurs from the MSB bit as a result of the operation, otherwise 0.

Execution example: CP HL,IX

When the HL register = 1234H and the IX register = 1234H, execution sets the Z and N flags to 1 and clears the S, H, V, and C flags to zero.

CPD src1, src2

< Compare Decrement >

Operation : $\text{src1} - \text{src2}$, $\text{BC} \leftarrow \text{BC} - 1$

Description : Compares the contents of src1 with those of src2, then decrements the contents of the BC register by 1. src1 must be the A or WA register. src2 must be in post-decrement register indirect addressing mode.

Details :

Byte	Size		Mnemonic	Code																
	Word	Long word																		
○	○	×	CPD	[A/WA, (R-)] <table border="1" style="margin-left: auto; margin-right: auto;"> <tr> <td>1</td><td>0</td><td>0</td><td>z</td><td>0</td><td> </td><td>R</td><td> </td></tr> <tr> <td>0</td><td>0</td><td>0</td><td>1</td><td>0</td><td>1</td><td>1</td><td>0</td></tr> </table>	1	0	0	z	0		R		0	0	0	1	0	1	1	0
1	0	0	z	0		R														
0	0	0	1	0	1	1	0													

Note : Omitting operands in square brackets [] specifies A,(XHL-).

Flags : S Z H V N C

*	*	*	*	1	-
---	---	---	---	---	---

S = MSB value of the result of src1-src2 is set.

Z = 1 is set if the result of src1-src2 is 0, otherwise 0.

H = 1 is set if a borrow from bit 3 to bit 4 occurs as a result of src1-src2, otherwise 0.

V = 0 is set if the BC register value is 0 after execution, otherwise 1.

N = 1 is set.

C = No change

Execution example: CPD A,(XIX-)

When the XIX register = 00123456H and the BC register = 0200H, execution compares the contents of the A register with those of memory address 123456H, then sets the XIX register to 00123455H, the BC register to 01FFH.

CPDR src1, src2

< Compare Decrement Repeat >

Operation : $\text{src1} - \text{src2}$, $\text{BC} \leftarrow \text{BC} - 1$, Repeat until $\text{src1} = \text{src2}$ or $\text{BC} = 0$

Description : Compares the contents of src1 with those of src2. Then decrements the contents of the BC register by 1. Repeats until $\text{src1} = \text{src2}$ or $\text{BC} = 0$. src1 must be the A or WA register. src2 must be in post-decrement register indirect addressing mode.

Details :

Byte	Size		Mnemonic	[A/WA, (R-)]	Code					
	Word	Long word								
○	○	×	CPDR	[A/WA, (R-)]	1	0	0	z	0	R
					0	0	0	1	0	1

Note : Omitting operands in square brackets [] specifies A,(XHL-).

Flags : S Z H V N C

*	*	*	*	1	-
---	---	---	---	---	---

S = MSB value of the result of $\text{src1} - \text{src2}$ is set.

Z = 1 is set if the result of $\text{src1} - \text{src2}$ is 0, otherwise 0.

H = 1 is set if a borrow from bit 3 to bit 4 occurs as a result of $\text{src1} - \text{src2}$, otherwise 0.

V = 0 is set if the BC register value is 0 after execution, otherwise 1.

N = 1 is set.

C = No change

Execution example: CPDR A,(XIX-)

Under the following conditions, execution reads the contents of memory addresses 123456H, 123455H, and 123454H. The instruction ends with condition BC = 0 and sets the XIX register to 00123453H and the BC register to 0000H.

Conditions: A register = 55H

XIX register = 00123456H

BC register = 0003H

Memory address 123456H = 11H

Memory address 123455H = 22H

Memory address 123454H = 33H

CPI src1, src2

< Compare Increment >

Operation : src1-src2, BC \leftarrow BC - 1

Description : Compares the contents of src1 with those of src2, then decrements the contents of the BC register by 1. src1 must be the A or WA register. src2 must be in post-increment register indirect addressing mode.

Details :

Byte	Size		Mnemonic	[A/WA, (R+)]	Code	
	Word	Long word				
○	○	×	CPI	[A/WA, (R+)]	1 0 0 z 0 R	0 0 0 1 0 1 0 0

Note : Omitting operands enclosed in square brackets [] specifies A,(XHL+).

Flags : S Z H V N C

*	*	*	*	1	-
---	---	---	---	---	---

S = MSB value of the result of src1-src2 is set.

Z = 1 is set if the result of src1-src2 is 0, otherwise 0.

H = 1 is set if a borrow from bit 3 to bit 4 occurs as a result of src1-src2, otherwise 0.

V = 0 is set if the BC register value is 0 after execution, otherwise 1.

N = 1 is set.

C = No change

Execution example: CPI A,(XIX +)

When the XIX register = 00123456H and the BC register = 0200H, execution compares the contents of the A register with those of memory address 123456H, and sets the XIX register to 00123457H and the BC register to 01FFH.

CPIR src1, src2

< Compare Increment Repeat >

Operation : src1-src2, BC \leftarrow BC - 1, repeat until src1 = src2 or BC = 0

Description : Compares the contents of src1 with those of src2. Then decrements the contents of the BC register by 1. Repeats until src1 = src2 or BC = 0. src1 must be the A or WA register. src2 must be in post-increment register indirect addressing mode.

Details :

Byte	Size		Mnemonic	[A/WA, (R+)]	Code	
	Word	Long word				
○	○	×	CPIR		1 0 0 z 0 R	0 0 0 1 0 1 0 1

Note : Omitting operands in square brackets [] specifies A,(XHL+).

Flags : S Z H V N C

*	*	*	*	1	-
---	---	---	---	---	---

S = MSB value of the result of src1-src2 is set.

Z = 1 is set if the result of src1-src2 is 0, otherwise 0.

H = 1 is set if a borrow from bit 3 to bit 4 occurs as a result of src1-src2, otherwise 0.

V = 0 is set if the BC register value is 0 after execution, otherwise 1.

N = 1 is set.

C = No change

Execution example: CPIR A,(XIX+)

Under the following conditions, execution reads memory addresses 123456H, 123457H, and 123458H. The instruction ends with condition src1 = src2, sets the XIX register to 00123459H and the BC register to 01FDH.

Conditions: A register = 33H

XIX register = 00123456H

BC register = 0200H

Memory address 123456H = 11H

Memory address 123457H = 22H

Memory address 123458H = 33H

CPL dst

< Complement >

Operation : dst \leftarrow Ones complement of dst

Description : Transfers the value of ones complement (inverted bit of 0/1) of dst to dst.

Details :

Byte	Word	Long word	Size	Mnemonic	Code																
○	○	×	CPL	r	<table border="1" style="margin-left: auto; margin-right: auto;"> <tr> <td>1</td><td>1</td><td>0</td><td>z</td><td>1</td><td> </td><td>r</td><td> </td> </tr> <tr> <td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>1</td><td>0</td> </tr> </table>	1	1	0	z	1		r		0	0	0	0	0	1	1	0
1	1	0	z	1		r															
0	0	0	0	0	1	1	0														

Flags : S Z H V N C

-	-	1	-	1	-
---	---	---	---	---	---

S = No change

Z = No change

H = 1 is set.

V = No change

N = 1 is set.

C = No change

Execution example: CPL WA

When the WA register = 1234H, execution sets the WA register to EDCBH.

DAA dst

< Decimal Adjust Accumulator >

Operation : dst \leftarrow decimal adjustment of dst

Description : Decimal adjusts the contents of dst depending on the states of the C, H, and N flags. Used to adjust the execution result of the add or subtract instruction as binary-coded decimal (BCD).

Details :

Byte	Size		Mnemonic	Code
	Word	Long word		
○	X	X	DAA	r 1 1 0 0 1 0 0 0 1 0 0 0 0

Operation	N flag before DAA instruction execution	C flag before DAA instruction execution	Upper 4 bits of dst	H flag before DAA instruction execution	Lower 4 bits of dst	Added value	C flag after DAA instruction execution
ADD	0	0	0 to 9	0	0 to 9	00	0
	0	0	0 to 8	0	A to F	06	0
	0	0	0 to 9	1	0 to 3	06	0
	0	0	A to F	0	0 to 9	60	1
ADC	0	0	9 to F	0	A to F	66	1
	0	0	A to F	1	0 to 3	66	1
	0	1	0 to 2	0	0 to 9	60	1
	0	1	0 to 2	0	A to F	66	1
SUB	0	1	0 to 3	1	0 to 3	66	1
	1	0	0 to 9	0	0 to 9	00	0
	1	0	0 to 8	1	6 to F	FA	0
	1	1	7 to F	0	0 to 9	A0	1
SBC	1	1	6 to F	1	6 to F	9A	1
	1	1	6 to F	1	6 to F	9A	1
NEG							

Note : Decimal adjustment cannot be performed for the INC or DEC instruction. This is because the C flag does not change.

Flags : S Z H V N C

*	*	*	*	-	*
---	---	---	---	---	---

S = MSB value of the result is set.

Z = 1 is set if the result is 0, otherwise 0.

H = 1 is set if a carry from bit 3 to bit 4 occurs as a result of the operation, otherwise 0.

V = 1 is set if the parity (number of 1s) of the result is even, otherwise 0.

N = No change

C = 1 is set if a carry occurs from the MSB as a result of the operation or a carry was 1 before operation, otherwise 0.

Execution example: ADD A,B

DAA A

When the A register = 59H and the B register = 13 H,
execution sets the A register to 72H.

DEC num, dst

< Decrement >

Operation : $dst \leftarrow dst - num$

Description : Decrements dst by the contents of num and transfers the result to dst.

Details :

Byte	Size		Mnemonic	#3, r	Code												
	Word	Long word															
○	○	○	DEC	#3, r	<table border="1" style="margin-left: auto; margin-right: auto;"> <tr><td>1</td><td>1</td><td>z</td><td>z</td><td>1</td><td>r</td></tr> <tr><td>0</td><td>1</td><td>1</td><td>0</td><td>1</td><td>#3</td></tr> </table>	1	1	z	z	1	r	0	1	1	0	1	#3
1	1	z	z	1	r												
0	1	1	0	1	#3												
○	○	×	DEC<W>	#3, (mem)	<table border="1" style="margin-left: auto; margin-right: auto;"> <tr><td>1</td><td>m</td><td>0</td><td>z</td><td>m</td><td>m m m</td></tr> <tr><td>0</td><td>1</td><td>1</td><td>0</td><td>1</td><td>#3</td></tr> </table>	1	m	0	z	m	m m m	0	1	1	0	1	#3
1	m	0	z	m	m m m												
0	1	1	0	1	#3												

Note : #3 in operands indicates from 1 to 8; object codes correspond from 1 to 7,0.

Flags : S Z H V N C

*	*	*	*	1	-
---	---	---	---	---	---

S = MSB value of the result is set.

Z = 1 is set if the result is 0, otherwise 0.

H = 1 is set if a borrow from bit 3 to bit 4 occurs as a result of the operation, otherwise 0.

V = 1 is set if an overflow occurs as a result of the operation, otherwise 0.

N = 1 is set.

C = No change

Note: With the DEC #3, r instruction, if the operand is a word or a long word, no flags change.

Execution example: DEC 4, HL

When the HL register = 5678H, execution sets the HL register to 5674H.

DECF

< Decrement Register File Pointer >

Operation : RFP_{<2:0>} ← RFP_{<2:0>} - 1

Description : Decrements the contents of register file pointer RFP _{<2:0>} in the status register by 1. RFP2 is fixed to 0.

Details :

Mnemonic	Code
DECF	0 0 0 0 1 1 0 1

Flags : S Z H V N C

--	--	--	--	--	--

- S = No change
- Z = No change
- H = No change
- V = No change
- N = No change
- C = No change

Execution example: DECF

When the contents of RFP_{<2:0>} = 2, execution sets the contents of RFP_{<2:0>} to 1.

DI

<Disable Interrupt>

Operation : IFF<2:0> ← 7

Description : Sets the contents of the interrupt enable flag (IFF) <2:0> in status register to 7. After execution, only non-maskable interrupts (interrupt level 7) can be received.

Details :

Mnemonic

INC num, dst

< Increment >

Operation : $dst \leftarrow dst + num$

Description : Adds the contents of dst and num and transfers the result to dst.

Details :

Byte	Size Word	Long word	Mnemonic		Code												
			INC	#3,r													
○	○	○	INC	#3,r	<table border="1" style="margin-left: auto; margin-right: auto;"> <tr><td>1</td><td>1</td><td>z</td><td>z</td><td>1</td><td>r</td></tr> <tr><td>0</td><td>1</td><td>1</td><td>0</td><td>0</td><td>#3</td></tr> </table>	1	1	z	z	1	r	0	1	1	0	0	#3
1	1	z	z	1	r												
0	1	1	0	0	#3												
○	○	×	INC<W>	#3,(mem)	<table border="1" style="margin-left: auto; margin-right: auto;"> <tr><td>1</td><td>m</td><td>0</td><td>z</td><td>m</td><td>m m m</td></tr> <tr><td>0</td><td>1</td><td>1</td><td>0</td><td>0</td><td>#3</td></tr> </table>	1	m	0	z	m	m m m	0	1	1	0	0	#3
1	m	0	z	m	m m m												
0	1	1	0	0	#3												

Note : #3 in operands indicates from 1 to 8 and object codes correspond from 1 to 7,0.

Flags : S Z H V N C

*	*	*	*	0	-
---	---	---	---	---	---

S = MSB value of the result is set.

Z = 1 is set if the result is 0, otherwise 0.

H = 1 is set if a carry occurs from bit 3 to bit 4 as a result of the operation, otherwise 0.

V = 1 is set if an overflow occurs as a result of the operation, otherwise 0.

N = Cleared to zero.

C = No change

Note: With the INC #3,r instruction, if the operand is a word or a long word, no flags change.

Execution example : INC 5,WA

When the WA register = 1234H, execution sets the WA register to 1239H.

INCF

< Increment Register File Pointer >

Operation : RFP<2:0> \leftarrow RFP<2:0> + 1

Description : Increments the contents of RFP<2:0> in the status register by 1. RFP2 is fixed to 0.

Details :

Mnemonic

Code

INCF

0	0	0	0	1	1	0	0
---	---	---	---	---	---	---	---

Flags : S Z H V N C

Flags : S Z H V N C

-	-	-	-	-	-
---	---	---	---	---	---

S = No change
Z = No change
H = No change
V = No change
N = No change
C = No change

Execution example: JP 2000H
Execution jumps unconditionally to address 2000H.

JP C, XIX + 2
When the carry flag = 1, execution jumps to address 123458H.
Condition: Register XIX = 00123456H

JR condition, dst

< Jump Relative >

Operation : If cc is true, then $PC \leftarrow dst$.

Description : If the operand condition is true, makes a relative jump to the program address specified by dst.

Details :

	Mnemonic	Code																						
JR	$[cc,] \$ + 2 + d8$	<table border="1"> <tr><td>0</td><td>1</td><td>1</td><td>0</td><td> </td><td>c</td><td>c</td><td> </td></tr> <tr><td colspan="7">d < 7:0 ></td></tr> </table>	0	1	1	0		c	c		d < 7:0 >													
0	1	1	0		c	c																		
d < 7:0 >																								
JRL	$[cc,] \$ + 3 + d16$	<table border="1"> <tr><td>0</td><td>1</td><td>1</td><td>1</td><td> </td><td>c</td><td>c</td><td> </td></tr> <tr><td colspan="7"># < 7:0 ></td></tr> <tr><td colspan="7"># < 15:8 ></td></tr> </table>	0	1	1	1		c	c		# < 7:0 >							# < 15:8 >						
0	1	1	1		c	c																		
# < 7:0 >																								
# < 15:8 >																								

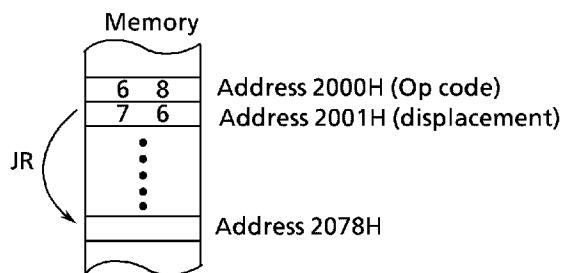

Flags : S Z H V N C

-	-	-	-	-	-
---	---	---	---	---	---

- S = No change
- Z = No change
- H = No change
- V = No change
- N = No change
- C = No change

Execution example: JR 2078H

When this instruction is executed at memory address 2000H, execution relative jumps unconditionally to address 2078H. The object code of the instruction is 68H : 76H.

LD dst, src

< Load >

Operation : dst \leftarrow src

Description : Loads the contents of src to dst.

Details :

Byte	Size Word	Long word	Mnemonic		Code																																				
			LD	R, r																																					
○	○	○	LD	R, r	<table border="1"> <tr><td>1</td><td>1</td><td>z</td><td>z</td><td>1</td><td>r</td></tr> <tr><td>1</td><td>0</td><td>0</td><td>0</td><td>1</td><td>R</td></tr> </table>	1	1	z	z	1	r	1	0	0	0	1	R

---	---	---	---	---	---	---

- S = No change
- Z = No change
- H = No change
- V = No change
- N = No change
- C = No change

Execution example: LD IX, DE

When the DE register=4567H, execution sets the IX register to 4567H.

LDA dst, src

< Load Address >

Operation : $dst \leftarrow src$ effective address value

Description : Loads the src effective address value to dst.

Details :

Byte	Size		Mnemonic	R, mem	Code							
	Word	Long word										
X	O	O	LDA	R, mem	1	m	1	1	m	m	m	m
					0	0	1	s	0		R	

Note : This instruction operates much like the ADD instruction; the difference is that dst is specified independently from src. Mainly used for handling the pointer with the C compiler.

Flags : S Z H V N C

-	-	-	-	-	-
---	---	---	---	---	---

S = No change

Z = No change

H = No change

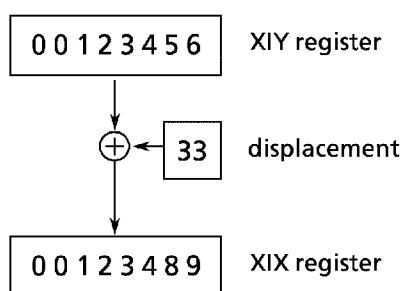

V = No change

N = No change

C = No change

Execution example: LDA XIX, XIY + 33H

When the XIY register = 00123456H, execution sets the XIX register to 00123489H.

LDAR dst, src

< Load Address Relative >

Operation : $dst \leftarrow src$ relative address value

Description : Loads the relative address value specified in src to dst.

Details :

Byte	Size Word	Long word	Mnemonic	Code
X	O	O	LDAR	R, \$+4+d16

d<7:0>
d<15:8>
0 | 0 | 1 | s | 0 | R |

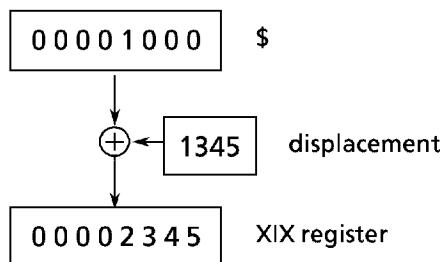

Flags : S Z H V N C

---	---	---	---	---	---

- S = No change
- Z = No change
- H = No change
- V = No change
- N = No change
- C = No change

Execution example: LDAR XIX, \$+1345H

When this instruction is executed at memory address 1000H, execution sets the XIX register to 00002345H. \$ indicates the start address of the instruction. The instruction's object codes are: F3H:13H:41H:13H:34H.

LDC dst, src

< Load Control Register >

Operation : $dst \leftarrow src$

Description : Loads the contents of src to dst.

Details :

Byte	Size		Mnemonic	Code																								
	Word	Long word																										
○	○	○	LDC	cr, r <table border="1" style="margin-left: auto; margin-right: auto;"> <tr><td>1</td><td>1</td><td>z</td><td>z</td><td>1</td><td></td><td>r</td><td></td></tr> <tr><td>0</td><td>0</td><td>1</td><td>0</td><td>1</td><td>1</td><td>1</td><td>0</td></tr> <tr><td colspan="8" style="text-align: center;">cr</td></tr> </table>	1	1	z	z	1		r		0	0	1	0	1	1	1	0	cr							
1	1	z	z	1		r																						
0	0	1	0	1	1	1	0																					
cr																												
○	○	○	LDC	r, cr <table border="1" style="margin-left: auto; margin-right: auto;"> <tr><td>1</td><td>1</td><td>z</td><td>z</td><td>1</td><td></td><td>r</td><td></td></tr> <tr><td>0</td><td>0</td><td>1</td><td>0</td><td>1</td><td>1</td><td>1</td><td>1</td></tr> <tr><td colspan="8" style="text-align: center;">cr</td></tr> </table>	1	1	z	z	1		r		0	0	1	0	1	1	1	1	cr							
1	1	z	z	1		r																						
0	0	1	0	1	1	1	1																					
cr																												

Flags : S Z H V N C

-	-	-	-	-	-
---	---	---	---	---	---

S = No change

Z = No change

H = No change

V = No change

N = No change

C = No change

Execution example: LDC DMAC0, WA

When the WA register = 1234H, execution sets control register DMAC0 to 1234H.

LDCF num, src

< Load Carry Flag >

Operation : CY \leftarrow src<num>

Description : Loads the contents of bit num of src to the carry flag.

Details :

Byte	Size Word	Long word	Mnemonic		Code																		
			LDCF	#4, r																			
○	○	×	LDCF	#4, r	<table border="1"> <tr><td>1</td><td>1</td><td>0</td><td>z</td><td>1</td><td>r</td></tr> <tr><td>0</td><td>0</td><td>1</td><td>0</td><td>0</td><td>1</td></tr> <tr><td>0</td><td>0</td><td>0</td><td>0</td><td>#</td><td>4</td></tr> </table>	1	1	0	z	1	r	0	0	1	0	0	1	0	0	0	0	#	4
1	1	0	z	1	r																		
0	0	1	0	0	1																		
0	0	0	0	#	4																		
○	○	×	LDCF	A, r	<table border="1"> <tr><td>1</td><td>1</td><td>0</td><td>z</td><td>1</td><td>r</td></tr> <tr><td>0</td><td>0</td><td>1</td><td>0</td><td>1</td><td>0</td></tr> <tr><td>1</td><td>0</td><td>0</td><td>1</td><td>1</td><td>#3</td></tr> </table>	1	1	0	z	1	r	0	0	1	0	1	0	1	0	0	1	1	#3
1	1	0	z	1	r																		
0	0	1	0	1	0																		
1	0	0	1	1	#3																		
○	×	×	LDCF	#3, (mem)	<table border="1"> <tr><td>1</td><td>m</td><td>1</td><td>1</td><td>m</td><td>m</td><td>m</td></tr> <tr><td>1</td><td>0</td><td>0</td><td>1</td><td>1</td><td></td><td>#3</td></tr> </table>	1	m	1	1	m	m	m	1	0	0	1	1		#3				
1	m	1	1	m	m	m																	
1	0	0	1	1		#3																	
○	×	×	LDCF	A, (mem)	<table border="1"> <tr><td>1</td><td>m</td><td>1</td><td>1</td><td>m</td><td>m</td><td>m</td></tr> <tr><td>0</td><td>0</td><td>1</td><td>0</td><td>1</td><td>0</td><td>1</td></tr> </table>	1	m	1	1	m	m	m	0	0	1	0	1	0	1				
1	m	1	1	m	m	m																	
0	0	1	0	1	0	1																	

Notes : When bit num is specified by the A register, the value of the lower 4 bits of the A register is used as bit num. When the operand is a byte and the value of the lower 4 bits of bit num is from 8 to 15, the value of the carry flag is undefined.

Flags : S Z H V N C

-	-	-	-	-	*
---	---	---	---	---	---

S = No change

Z = No change

H = No change

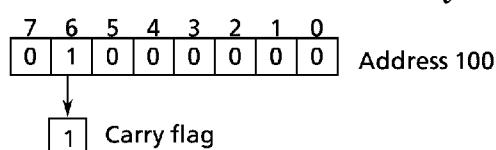

V = No change

N = No change

C = Contents of bit num of src is set.

Execution example: LDCF 6,(100H)

When the contents of memoryad address 100 = 01000000B (binary), execution sets the carry flag to 1.

LDD dst, src

< Load Decrement >

Operation : $dst \leftarrow src, BC \leftarrow BC - 1$

Description : Loads the contents of src to dst, then decrements the contents of the BC register by 1. src and dst must be in post-decrement register indirect addressing mode.

Details :

Byte	Size		Mnemonic	Code																
	Word	Long word																		
○	○	×	LDD<W> [(XDE-), (XHL-)]	<table border="1" style="display: inline-table; vertical-align: middle;"> <tr><td>1</td><td>0</td><td>0</td><td>z</td><td>0</td><td>0</td><td>1</td><td>1</td></tr> <tr><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td><td>0</td><td>1</td><td>0</td></tr> </table>	1	0	0	z	0	0	1	1	0	0	0	1	0	0	1	0
1	0	0	z	0	0	1	1													
0	0	0	1	0	0	1	0													
○	○	×	LDD<W> (XIX-), (XIY-)	<table border="1" style="display: inline-table; vertical-align: middle;"> <tr><td>1</td><td>0</td><td>0</td><td>z</td><td>0</td><td>1</td><td>0</td><td>1</td></tr> <tr><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td><td>0</td><td>1</td><td>0</td></tr> </table>	1	0	0	z	0	1	0	1	0	0	0	1	0	0	1	0
1	0	0	z	0	1	0	1													
0	0	0	1	0	0	1	0													

* Coding in square brackets [] can be omitted.

Flags : S Z H V N C

-	-	0	*	0	-
---	---	---	---	---	---

S = No change

Z = No change

H = Cleared to 0.

V = 0 is set if the BC register value is 0 after execution, otherwise 1.

N = Cleared to zero.

C = No change

Execution example: LDD (XIX-), (XIY-)

When the XIX register = 00123456H, the XIY register = 00335577H, and the BC register = 0700H, the results of the execution are as follows:

Loads the contents of address 335577H to 123456H.

Sets the XIX register to 00123456H.

Sets the XIY register to 00335576H.

Sets the BC register to 06FFH.

LDDR dst, src

< Load Decrement Repeat >

Operation : $dst \leftarrow src, BC \leftarrow BC - 1$, Repeat until $BC = 0$

Description : Loads the contents of src to dst, then decrements the contents of the BC register by 1. If the result is other than 0, the operation is repeated. src and dst must be in post-decrement register indirect addressing mode.

Details :

Byte	Size		Mnemonic	Code																
	Word	Long word																		
○	○	×	LDDR<W>[(XDE-), (XHL-)]	<table border="1" style="margin-left: auto; margin-right: auto;"> <tr><td>1</td><td>0</td><td>0</td><td>z</td><td>0</td><td>0</td><td>1</td><td>1</td></tr> <tr><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td><td>0</td><td>1</td><td>1</td></tr> </table>	1	0	0	z	0	0	1	1	0	0	0	1	0	0	1	1
1	0	0	z	0	0	1	1													
0	0	0	1	0	0	1	1													
○	○	×	LDDR<W> (XIX-), (XIY-)	<table border="1" style="margin-left: auto; margin-right: auto;"> <tr><td>1</td><td>0</td><td>0</td><td>z</td><td>0</td><td>1</td><td>0</td><td>1</td></tr> <tr><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td><td>0</td><td>1</td><td>1</td></tr> </table>	1	0	0	z	0	1	0	1	0	0	0	1	0	0	1	1
1	0	0	z	0	1	0	1													
0	0	0	1	0	0	1	1													

* Coding in square brackets [] can be omitted.

Note : Interrupt requests are sampled every time 1 item of data is loaded.

Flags : S Z H V N C

-	-	0	0	0	-
---	---	---	---	---	---

S = No change

Z = No change

H = Cleared to zero.

V = Cleared to zero.

N = Cleared to zero.

C = No change

Execution example: LDDR (XIX-), (XIY-)

When the XIX register = 00123456H, the XIY register = 00335577H, and the BC register = 0003H, the results of the execution are as follows:

Loads the contents of address 335577H to 123456H.

Loads the contents of address 335576H to 123455H.

Loads the contents of address 335575H to 123454H.

Sets the XIX register to 00123453H.

Sets the XIY register to 00335574H.

Sets the BC register to 0000H.

LDF num

< Load Register File Pointer>

Operation : RFP<2:0> \leftarrow num

Description : Loads the num value to the register file pointer RFP<2:0> in status register. RFP2 is fixed to 0.

Details :

Mnemonic	Code																
LDF #3	<table border="1"> <tr> <td>0</td><td>0</td><td>0</td><td>1</td><td>0</td><td>1</td><td>1</td><td>1</td> </tr> <tr> <td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td colspan="3">#3</td> </tr> </table>	0	0	0	1	0	1	1	1	0	0	0	0	0	#3		
0	0	0	1	0	1	1	1										
0	0	0	0	0	#3												

Note : In minimum mode, the operand value can be specified from 0 to 7; in maximum mode, from 0 to 3.

Flags : S Z H V N C

-	-	-	-	-	-
---	---	---	---	---	---

- S = No change
- Z = No change
- H = No change
- V = No change
- N = No change
- C = No change

LDI dst, src

< Load Increment >

Operation : $dst \leftarrow src, BC \leftarrow BC - 1$

Description : Loads the contents of src to dst, then decrements the contents of the BC register by 1. src and dst must be in post-increment register indirect addressing mode.

Details :

Byte	Size		Mnemonic	Code																
	Word	Long word																		
○	○	×	LDI<W> [(XDE+), (XHL+)]	<table border="1" style="margin-left: auto; margin-right: auto;"> <tr><td>1</td><td>0</td><td>0</td><td>z</td><td>0</td><td>0</td><td>1</td><td>1</td></tr> <tr><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td><td>0</td><td>0</td><td>0</td></tr> </table>	1	0	0	z	0	0	1	1	0	0	0	1	0	0	0	0

S = No change

Z = No change

H = Cleared to zero.

V = 0 is set when the BC register value is 0 after execution, otherwise 1.

N = Cleared to zero.

C = No change

Execution example: LDI (XIX+), (XIY+)

When the XIX register = 00123456H, the XIY register = 00335577H, and the BC register = 0700H, execution results as follows:

Loads the contents of address 335577H to 123456H.

Sets the XIX register to 00123457H.

Sets the XIY register to 00335578H.

Sets the BC register to 06FFH.

LDIR dst, src

< Load Increment Repeat >

Operation : $dst \leftarrow src$, $BC \leftarrow BC - 1$, Repeat until $BC = 0$

Description : Loads the contents of src to dst, then decrements the contents of the BC register by 1. If the result is other than 0, the operation is repeated. src and dst must be in post-increment register indirect addressing mode.

Details :

Byte	Size		Mnemonic	Code																
	Word	Long word																		
○	○	×	LDIR<W>[(XDE+),(XHL+)]	<table border="1" style="margin-left: auto; margin-right: auto;"> <tr><td>1</td><td>0</td><td>0</td><td>z</td><td>0</td><td>0</td><td>1</td><td>1</td></tr> <tr><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td><td>0</td><td>0</td><td>1</td></tr> </table>	1	0	0	z	0	0	1	1	0	0	0	1	0	0	0	1
1	0	0	z	0	0	1	1													
0	0	0	1	0	0	0	1													
○	○	×	LDIR<W>(XIX+),(XIY+)	<table border="1" style="margin-left: auto; margin-right: auto;"> <tr><td>1</td><td>0</td><td>0</td><td>z</td><td>0</td><td>1</td><td>0</td><td>1</td></tr> <tr><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td><td>0</td><td>0</td><td>1</td></tr> </table>	1	0	0	z	0	1	0	1	0	0	0	1	0	0	0	1
1	0	0	z	0	1	0	1													
0	0	0	1	0	0	0	1													

* Coding in square brackets [] can be omitted.

Note : Interrupt requests are sampled every time 1 item of data is loaded.

S = No change

Z = No change

H = Cleared to zero.

V = Cleared to zero.

N = Cleared to zero.

C = No change

Execution example: LDIR (XIX+),(XIY+)

When the XIX register = 00123456H, the XIY register = 00335577H, and the BC register = 0003H, execution results as follows:

Loads the contents of address 335577H to 123456H.

Loads the contents of address 335578H to 123457H.

Loads the contents of address 335579H to 123458H.

Sets the XIX register to 00123459H.

Sets the XIY register to 0033557AH.

Sets the BC register to 0000H.

LDX dst, src

< Load eXtract >

Operation : $dst \leftarrow src$

Description : Loads the contents of src to dst. The effective code is assigned to this instruction every other byte. Used to fetch the code from 8-bit data bus memory in 16-bit data bus mode.

Details :

Byte	Size		Mnemonic	(#8) , #	Code																																																
	Word	Long word																																																			
○	×	×	LDX	(#8) , #	<table border="1" style="margin-left: auto; margin-right: auto;"> <tr><td>1</td><td>1</td><td>1</td><td>1</td><td>0</td><td>1</td><td>1</td><td>1</td></tr> <tr><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td></tr> <tr><td colspan="8">#8</td></tr> <tr><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td></tr> <tr><td colspan="8">#</td></tr> <tr><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td></tr> </table>	1	1	1	1	0	1	1	1	0	0	0	0	0	0	0	0	#8								0	0	0	0	0	0	0	0	#								0	0	0	0	0	0	0	0

---	---	---	---	---	---

- S = No change
- Z = No change
- H = No change
- V = No change
- N = No change
- C = No change

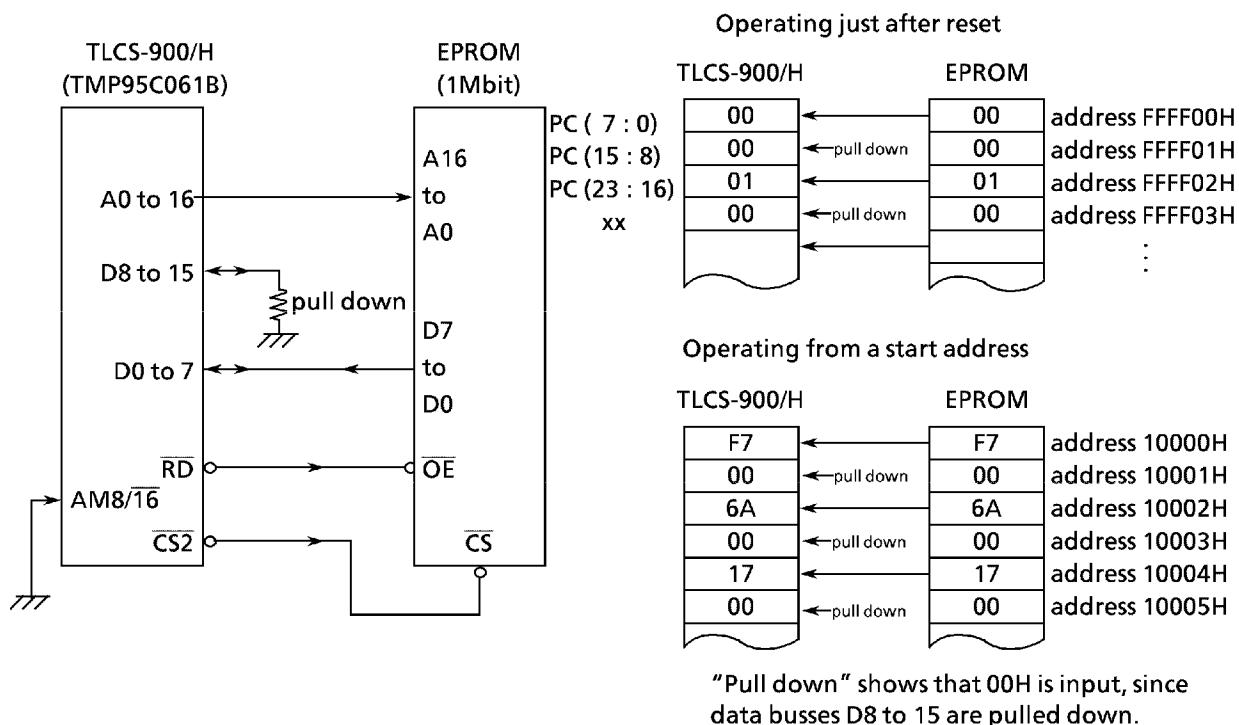

Execution example: In TMP95C061B, an example to run a program with EPROM which has a data bus of 8-bit size is shown as follows:

When $AM8/16$ pin is fixed to low level at reset, TMP95C061B starts fetching a start address in 16-bit data bus mode from address FFFF00H of the reset vector. When a program is started with an external memory which has 8-bit data bus, the data buses D8 to 15 pins must be fixed with pull-up/down at the upper side.

For example, when a start address of the program is set to address 10000H, place address 10000H to address FFFF00H of a memory address and fix the data buses D8 to 15 to pull-down. Additionally, place an instruction mentioned below to address 10000H of a start address.

LDX (6AH), 17H

The instruction mentioned above is performed, and a data of 17H is written to a control register which is located at address 6AH in a built-in programmable chip select/wait controller. As a result, memory addresses 000080H to FFFFFFFH become 0WAIT mode with 8-bit data bus.

LINK dst, num

< Link >

Operation : $(-\text{XSP}) \leftarrow \text{dst}, \text{dst} \leftarrow \text{XSP}, \text{XSP} \leftarrow \text{XSP} + \text{num}$

Description : Saves the contents of dst to the stack area. Loads the contents of stack pointer XSP to dst. Adds the contents of XSP to those of num (signed) and loads the result to XSP. Used for obtaining a local variable area in the stack area for -num bytes.

Details :

Byte	Size		Mnemonic	Code
	Word	Long word		
X	X	O	LINK	r, d16

1 | 1 | 1 | 0 | 1 | r |
 0 | 0 | 0 | 0 | 1 | 1 | 0 | 0
 d<7:0>
 d<15:8>

Flags : S Z H V N C

-	-	-	-	-	-
---	---	---	---	---	---

S = No change

Z = No change

H = No change

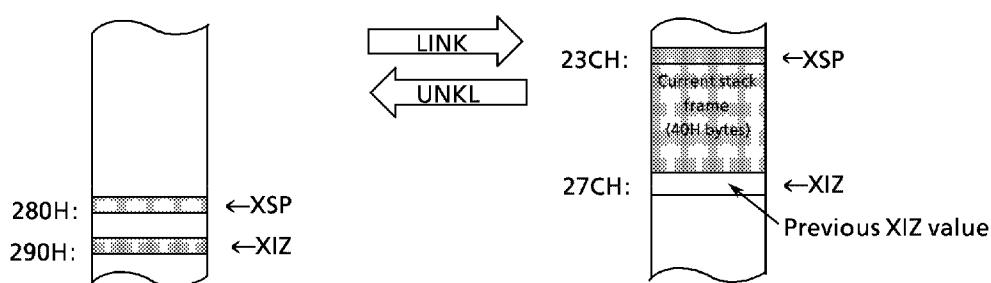

V = No change

N = No change

C = No change

Execution example: LINK XIZ, -40H

When stack pointer XSP = 280H and the XIZ register = 290H, execution writes 00000290H (long data) at memory address 27CH and sets the XIZ register to 27CH and the stack pointer to XSP 23CH.

MDEC1 num, dst

< Modulo Decrement 1 >

Operation : if (dst mod num) = 0 then dst \leftarrow dst + (num - 1) else dst \leftarrow dst - 1.

Description : When the modulo num of dst is 0, increments dst by num - 1 .

Otherwise, decrements dst by 1. Used to operate pointers for cyclic memory table.

Details :

Byte	Size		Mnemonic	# , r	Code	
	Word	Long word				
X	O	X	MDEC1	# , r	1 1 0 1 1	r
					0 0 1 1 1	0 0
					#<7:0>-1	
					#<15:8>	

Note : The operand # must be 2 to the nth power. (n = 1 to 15)

Flags : S Z H V N C

-	-	-	-	-	-
---	---	---	---	---	---

S = No change

Z = No change

H = No change

V = No change

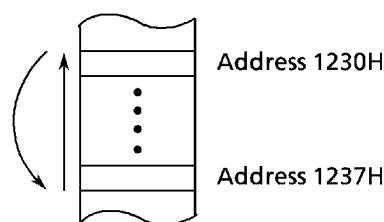

N = No change

C = No change

Execution example: Decrements the IX register by cycling from 1230H to 1237H.

MDEC1 8, IX

When the IX register = 1231H, execution sets the IX register to 1230H. Further execution increments the IX register by 8-1 and sets the IX register to 1237H, since the IX register modulo 8 = 0.

MDEC2 num, dst

< Modulo Decrement 2 >

Operation : if (dst mod num) = 0 then dst \leftarrow dst + (num - 2) else dst \leftarrow dst - 2.

Description : When the modulo num of dst is 0, increments dst by num - 2.
 Otherwise, decrements dst by 2. Used to operate pointers for cyclic memory table.

Details :

Byte	Size		Mnemonic	#, r	Code
	Word	Long word			
X	O	X	MDEC2		
					1 1 0 1 1 r
					0 0 1 1 1 1 0 1
					#<7:0>-2
					#<15:8>

Note : The operand # must be 2 to the nth power. (n = 2 to 15)

Flags : S Z H V N C

- S = No change
- Z = No change
- H = No change
- V = No change
- N = No change
- C = No change

Execution example: Decrements the IX register by cycling from 1280H to 12FFH.

MDEC4 80H,IX

When the IX register = 1284H, execution sets the IX register to 1280H. Further execution increments the IX register by 80H-4 and sets the IX register to 12FCH, since the IX register modulo 80H = 0.

MINC1 num, dst

< Modulo Increment 1 >

Operation : if (dst mod num) = (num - 1) then dst \leftarrow dst - (num - 1) else dst \leftarrow dst + 1.

Description : When the modulo num of dst is num - 1, decrements dst by num - 1.
 Otherwise, increments dst by 1. Used to operate pointers for cyclic memory table.

Details :

Byte	Size		Mnemonic	# , r	Code
	Word	Long word			
X	O	X	MINC1	# , r	1 1 0 1 1 r 0 0 1 1 1 0 0 0 # <7:0> -1 # <15:8>

Note : The operand # must be 2 to the nth power. (n = 1 to 15)

Flags : S Z H V N C

-	-	-	-	-	-
---	---	---	---	---	---

S = No change

Z = No change

H = No change

V = No change

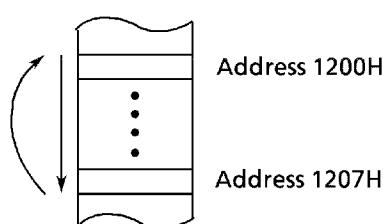

N = No change

C = No change

Execution example: Increments the IX register by cycling from 1200H to 1207H.

MINC1 8, IX

When the IX register = 1206H, execution sets the IX register to 1207H. Further execution decrements the IX register by 8 - 1 and sets the IX register to 1200H, since the IX register modulo 8 = 8 - 1.

MINC2 num, dst

< Modulo Increment 2 >

Operation : if (dst mod num) = (num - 2) then dst \leftarrow dst - (num - 2) else dst \leftarrow dst + 2.

Description : When the modulo num of dst is num - 2, decrements dst by num - 2.
Otherwise, increments dst by 2. Used to operate pointers for cyclic memory table.

Details :

Byte	Size		Mnemonic	# , r	Code																														
	Word	Long word																																	
X	O	X	MINC2	# , r	<table border="1" style="margin-left: auto; margin-right: auto;"> <tr><td>1</td><td>1</td><td>0</td><td>1</td><td>1</td><td></td><td>r</td><td></td></tr> <tr><td>0</td><td>0</td><td>1</td><td>1</td><td>1</td><td>0</td><td>0</td><td>1</td></tr> <tr><td colspan="7"># <7:0> - 2</td></tr> <tr><td colspan="7"># <15:8></td></tr> </table>	1	1	0	1	1		r		0	0	1	1	1	0	0	1	# <7:0> - 2							# <15:8>

Execution example: MUL XIX,IY

When the IX register = 1234H and the IY register = 89ABH, execution multiplies unsigned the contents of the IX register by those of the IY register and sets the XIX register to 09C9FCBCH.

Note : "RR" for the MUL RR,r and MUL RR,(mem) instructions is as listed below:

Operation size in bytes
(16 bits ← 8 bits × 8 bits)

RR	Code R
WA	001
BC	011
DE	101
HL	111
IX	
IY	
IZ	
SP	

Operation size in words
(32 bits ← 16 bits × 16 bits)

RR	Code R
XWA	000
XBC	001
XDE	010
XHL	011
XIX	100
XIY	101
XIZ	110
XSP	111

"rr" for the MUL rr,# instruction is as listed below.

Operation size in bytes
(16 bits ← 8 bits × 8 bits)

rr	Code r
WA	001
BC	011
DE	101
HL	111
IX	C7H : F0H
IY	C7H : F4H
IZ	C7H : F8H
SP	<u>C7H</u> : <u>FCH</u>

1st byte 2nd byte

Note: Any other word registers can be specified in the same extension coding as those for IX to SP.

Operation size in words
(32 bits ← 16 bits × 16 bits)

rr	Code r
XWA	000
XBC	001
XDE	010
XHL	011
XIX	100
XIY	101
XIZ	110
XSP	111

Note: Any other long word registers can be specified in the extension coding.

MULA dst

< Multiply and Add >

Operation : $dst \leftarrow dst + (XDE) \times (XHL)$, $XHL \leftarrow XHL - 2$

Description : Multiplies signed the memory data (16 bits) specified by the XDE register by the memory data (16 bits) specified by the XHL register . Adds the result (32 bits) to the contents of dst (32 bits) and loads the sum to dst (32 bits). Then, decrements the contents of the XHL register by 2.

Details :

Byte	Size		Mnemonic	Code
	Word	Long word		
X	O	X	MULA	rr

1	1	0	1	1		r	
0	0	0	1	1	0	0	1

Note : Match coding of the operand dst with the operation size (long word).

Flags : S Z H V N C

C = No change

Execution example: MULS XIX,IY

When the IX register = 1234H and the IY register = 89ABH, execution multiplies signed the contents of the IX register by those of the IY register and sets the XIX register to F795FCBCH.

Note : “RR” for the MULS RR,r and MULS RR,(mem) instructions is as listed below:

Operation size in bytes
(16 bits←8 bits × 8 bits)

RR	Code R
WA	001
BC	011
DE	101
HL	111
IX	
IY	
IZ	
SP	

} Specification not possible!

Operation size in words
(32 bits←16 bits × 16 bits)

RR	Code R
XWA	000
XBC	001
XDE	010
XHL	011
XIX	100
XIY	101
XIZ	110
XSP	111

“rr” for the MULS rr,# instruction is as listed below.

Operation size in bytes
(16 bits←8 bits × 8 bits)

rr	Code r
WA	001
BC	011
DE	101
HL	111
IX	C7H : F0H
IY	C7H : F4H
IZ	C7H : F8H
SP	C7H : FCH

1st byte 2nd byte

Operation size in words
(32 bits←16 bits × 16 bits)

rr	Code r
XWA	000
XBC	001
XDE	010
XHL	011
XIX	100
XIY	101
XIZ	110
XSP	111

*1 Any other word registers can be specified in the same extension coding as those for IX to SP.

*2 Any other long word registers can be specified in the extension coding.

NEG dst

< Negate >

Operation : $dst \leftarrow 0 - dst$ Description : Decrements 0 by the contents of dst and loads the result to dst.
(Twos complement)

Details :

Byte	Size		Mnemonic	Code
	Word	Long word		
○	○	×	NEG	r 1 1 0 z 1 r 0 0 0 0 0 1 1 1

Flags : S Z H V N C

*	*	*	*	1	*
---	---	---	---	---	---

S = MSB value of the result is set.

Z = 1 is set when the result is 0, otherwise 0.

H = 1 is set when a borrow from bit 3 to bit 4 occurs as a result, otherwise 0.

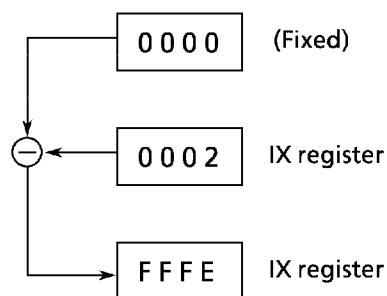

V = 1 is set when an overflow occurs as a result, otherwise 0.

N = 1 is set.

C = 1 is set when a borrow from the MSB occurs as a result, otherwise 0.

Execution example: NEG IX

When the IX register = 0002H, execution sets the IX register to FFFEH.

NOP

<No Operation>

Operation : None.

Description : Does nothing but moves execution to the next instruction. The object code of this instruction is 00H.

Details :

Mnemonic	Code								
NOP	<table border="1"><tr><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td></tr></table>	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0		

Flags : S Z H V N C

-	-	-	-	-	-
---	---	---	---	---	---

S = No change

Z = No change

H = No change

V = No change

N = No change

C = No change

OR dst, src

< Logical OR >

Operation : dst \leftarrow dst OR src

Description : Ors the contents of dst with those of src and loads the result to dst.

(Truth table)

A	B	A OR B
0	0	0
0	1	1
1	0	1
1	1	1

Flags : S Z H V N C

*	*	0	*	0	0
---	---	---	---	---	---

- S = MSB value of the result is set.
- Z = 1 is set when the result is 0, otherwise 0.
- H = 0 is set.
- V = 1 is set when the parity (number of 1s) of the result is even, 0 when odd.
When the operand is 32-bit, an undefined value is set.
- N = Cleared to 0.
- C = Cleared to 0.

Execution example: OR HL, IX

When the HL register = 7350H and the IX register is 3456H, execution sets the HL register to 7756H.

0111	0011	0101	0000	← HL register (before execution)
<u>OR)</u>	<u>0011</u>	<u>0100</u>	<u>0101</u>	<u>0110</u> ← IX register (before execution)
				0111 0111 0101 0110 ← HL register (after execution)

ORCF num, src

< OR Carry Flag >

Operation : CY \leftarrow CY OR src<num>

Description : Ors the contents of the carry flag with those of bit num of src and loads the result to the carry flag.

Details :

Byte	Size		Mnemonic	Code
	Word	Long word		
○	○	×	ORCF	#4, r
○	○	×	ORCF	A, r
○	×	×	ORCF	#3, (mem)
○	×	×	ORCF	A, (mem)

Note : When bit num is specified by the A register, the value of the lower 4 bits of the A register is used as bit num. When the operand is a byte and the value of the lower bits of bit num is from 8 to 15, the result is undefined.

flag : S Z H V N C

-	-	-	-	-	*
---	---	---	---	---	---

S = No change

Z = No change

H = No change

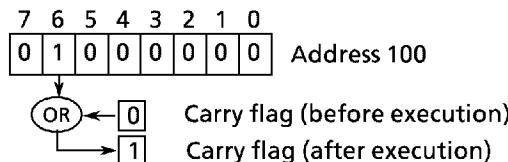

V = No change

N = No change

C = The result of or-ing the contents of the carry flag with those of bit num of src is set.

Execution example: ORCF 6, (100H)

When the contents of memory at address 100H = 01000000B (binary) and the carry flag = 0, execution sets the carry flag to 1.

PAA dst

< Pointer Adjust Accumulator >

Operation : if dst <LSB> = 1 then dst \leftarrow dst + 1

Description : Increments dst by 1 when the LSB of dst is 1. Does nothing when the LSB of dst is 0.

Used to make the contents of dst even. With the TLCS-900 series, when accessing 16- or 32-bit data in memory, if the data are loaded from an address starting with an even number, the number of bus cycles is 1 less than that of the data loaded from an address starting with an odd number.

Details :

Byte	Size		Mnemonic	Code																
	Word	Long word																		
X	○	○	PAA	r <table border="1" style="margin-left: auto; margin-right: auto;"> <tr> <td>1</td><td>1</td><td>z</td><td>z</td><td>1</td><td></td><td>r</td><td></td> </tr> <tr> <td>0</td><td>0</td><td>0</td><td>1</td><td>0</td><td>1</td><td>0</td><td>0</td> </tr> </table>	1	1	z	z	1		r		0	0	0	1	0	1	0	0
1	1	z	z	1		r														
0	0	0	1	0	1	0	0													

Flags : S Z H V N C

-	-	-	-	-	-
---	---	---	---	---	---

S = No change

Z = No change

H = No change

V = No change

N = No change

C = No change

Execution example: PAA XIZ

When the XIZ register = 00234567H, execution increments the XIZ register by 1 so that it becomes 00234568H.

POP dst

< Pop >

Operation : $dst \leftarrow (XSP +)$ [In bytes : $dst \leftarrow (XSP)$, $XSP \leftarrow XSP + 1$
 In words : $dst \leftarrow (XSP)$, $XSP \leftarrow XSP + 2$
 In long words : $dst \leftarrow (XSP)$, $XSP \leftarrow XSP + 4$]

Description : First loads the contents of memory address specified by the stack pointer XSP to dst. Then increments the stack pointer XSP by the number of bytes in the operand.

Details :

Byte	Size	Mnemonic		Code
	Word	Long word		
○	×	×	POP	F 0 0 0 1 1 0 0 1
○	×	×	POP	A 0 0 0 1 0 1 0 1
×	○	○	POP	R 0 1 0 s 1 R
○	○	○	POP	r 1 1 z z 1 r 0 0 0 0 0 1 0 1
○	○	×	POP<W> (mem)	 1 m 1 1 m m m m 0 0 0 0 0 1 z 0

Flags : S Z H V N C

-	-	-	-	-	-
---	---	---	---	---	---

S = No change

Z = No change

H = No change

V = No change

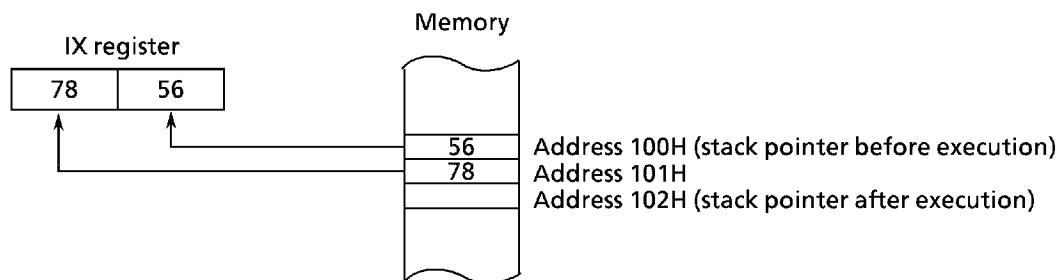

N = No change

C = No change

(Note) Executing POP F changes all flags.

Execution example: POP IX

When the stack pointer XSP = 0100H, the contents of address 100H = 56H, and the contents of address 101H = 78H, execution sets the IX register to 7856H and the stack pointer XSP to 0102H.

POP SR

< Pop SR >

Operation : $SR \leftarrow (XSP +)$

Description : Loads the contents of the address specified by the stack pointer XSP to status register. Then increments the contents of the stack pointer XSP by 2.

Details :

Byte	Size		Mnemonic	Code
	Word	Long word		
X	O	X	POP	SR

Flags : S Z H V N C

*	*	*	*	*	*
---	---	---	---	---	---

S =
Z =
H =
V =
N =
C =

Contents of the memory address specified by the stack pointer XSP are set.

Note1: Please execute this instruction during DI condition. The timing for executing this instruction is delayed by several states than that for fetching the instruction. This is because an instruction queue (4 bytes) and pipeline processing method is used.

Note2: When this instruction is executed, change all bits in the SR. If there are the bits which must not change (example: the minimum mode is not supported for 900/H, therefor, the SR<MAX> register must be set to "1"), prevent the bits from changing.

PUSH SR

<Push SR>

Operation : $(-\text{XSP}) \leftarrow \text{SR}$

Description : Decrements the contents of the stack pointer XSP by 2. Then loads the contents of status register to the memory address specified by the stack pointer XSP.

Details :

Byte	Size		Mnemonic	Code
	Word	Long word		
X	○	X	PUSH SR	0 0 0 0 0 0 1 0

Flags : S Z H V N C

-	-	-	-	-	-
---	---	---	---	---	---

- S = No change
- Z = No change
- H = No change
- V = No change
- N = No change
- C = No change

PUSH src

< Push >

Operation : $(-\text{XSP}) \leftarrow \text{src}$

[In bytes]	: $\text{XSP} \leftarrow \text{XSP} - 1, (\text{XSP}) \leftarrow \text{src}$
[In words]	: $\text{XSP} \leftarrow \text{XSP} - 2, (\text{XSP}) \leftarrow \text{src}$
[In long words]	: $\text{XSP} \leftarrow \text{XSP} - 4, (\text{XSP}) \leftarrow \text{src}$

Description : Decrements the stack pointer XSP by the byte length of the operand.
Then loads the contents of src to the memory address specified by the stack pointer XSP.

Details :

Byte	Size	Mnemonic	Code
	Word	Long word	
○	×	×	PUSH F 0 0 0 1 1 0 0 0
○	×	×	PUSH A 0 0 0 1 0 1 0 0
×	○	○	PUSH R 0 0 1 s 1 R
○	○	○	PUSH r 1 1 z z 1 r 0 0 0 0 0 1 0 0
○	○	×	PUSH<W> # 0 0 0 0 1 0 z 1 #<7:0> #<15:8>
○	○	×	PUSH<W> (mem) 1 m 0 z m m m m 0 0 0 0 0 1 0 0

Flags : S Z H V N C

-	-	-	-	-	-
---	---	---	---	---	---

S = No change

Z = No change

H = No change

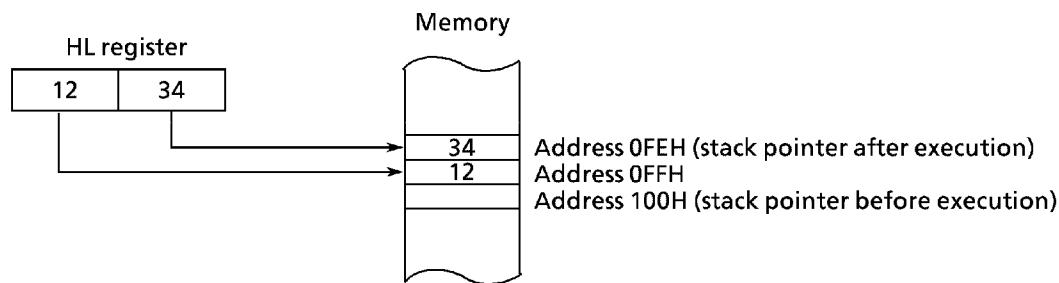

V = No change

N = No change

C = No change

Execution example: PUSH HL

When the stack pointer XSP = 0100H and the HL register = 1234H, execution changes address 00FEH to 34H, address 00FFH to 12H, and sets the stack pointer XSP to 00FEH.

RCF

< Reset Carry Flag >

Operation : CY \leftarrow 0

Description : Resets the carry flag to 0.

Details :

Mnemonic

Code

RCF

0		0		0		1		0		0		0		0

1	m	1	1	m	m	m																				
1	0	1	1	0		#3																				

Flags : S Z H V N C

-	-	-	-	-	-
---	---	---	---	---	---

S = No change

Z = No change

H = No change

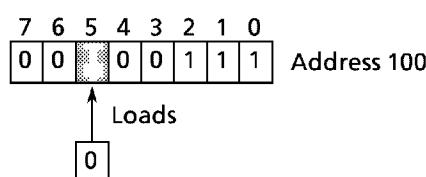

V = No change

N = No change

C = No change

Execution example: RES 5,(100H)

When the contents of memory at address 100H = 00100111B (binary), execution sets the contents to 00000111B (binary).

RET condition

< Return >

Operation : If cc is true, then the 32-bit PC \leftarrow (XSP), XSP \leftarrow XSP + 4.

Description : Pops the return address from the stack area to the program counter when the operand condition is true.

Details :

Mnemonic	Code
RET	0 0 0 0 1 1 1 0
RET cc	1 0 1 1 0 0 0 0 1 1 1 1 c c

Flags : S Z H V N C

--	--	--	--	--	--

S = No change

Z = No change

H = No change

V = No change

N = No change

C = No change

Execution example: RET

When the stack pointer XSP = 0FCH and the contents of memory at address 0FCH = 9000H (long word data), execution sets the stack pointer XSP to 100H and jumps (returns) to address 9000H.

RETD num

< Return and Deallocate >

Operation : 32-bit PC \leftarrow (XSP), XSP \leftarrow XSP + 4, XSP \leftarrow XSP + num

Description : Pops the return address from the stack area to the program counter. Then increments the stack pointer XSP by signed num.

Details :

Mnemonic	Code																								
RETD d16	<table border="1"> <tr><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>1</td><td>1</td><td>1</td></tr> <tr><td colspan="8">d<7:0></td></tr> <tr><td colspan="8">d<15:8></td></tr> </table>	0	0	0	0	1	1	1	1	d<7:0>								d<15:8>							
0	0	0	0	1	1	1	1																		
d<7:0>																									
d<15:8>																									

Flags : S Z H V N C

-	-	-	-	-	-
---	---	---	---	---	---

S = No change

Z = No change

H = No change

V = No change

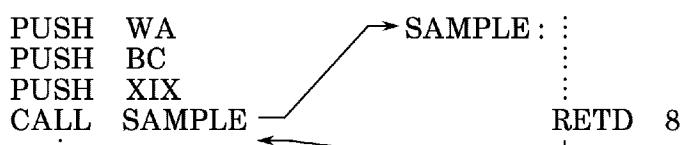

N = No change

C = No change

Execution example: RETD 8

When the stack pointer XSP = 0FCH and the contents of memory at address 0FCH = 9000H (long word data) in minimum mode, execution sets the stack pointer XSP to 0FCH + 4 + 8 \rightarrow 108H and jumps (returns) to address 9000H.

Usage of the RETD instruction is shown below. In this example, the 8-bit parameter is pushed to the stack before the subroutine call. After the subroutine processing complete, the used parameter area is deleted by the RETD instruction.

RETI

< Return from Interrupt >

Operation : SR \leftarrow (XSP), 32-bit PC \leftarrow (XSP + 2), XSP \leftarrow XSP + 6

After the above operation is executed, the 900/H decrement a value of interrupt nesting counter INTNEST by 1.

Description : Pops data from the stack area to status register and program counter.

After the above operation is executed, the 900/H decrement a value of interrupt nesting counter INTNEST by 1.

Details :

Mnemonic

V = 1 is set when the parity (number of 1s) of dst is even after rotate. If the operand is 32 bits, an undefined value is set.

N = Reset to 0.

C = MSB value of dst before the last rotate is set.

Execution example: RLC 4, HL

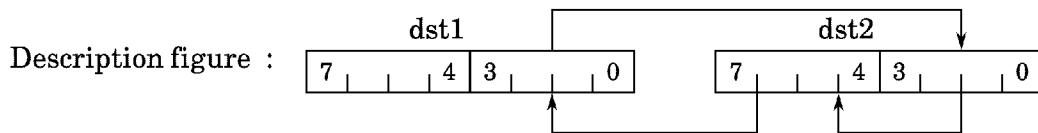

When the HL register = 1230H, execution sets the HL register to 2301H and the carry flag to 1.

RLD dst1, dst2

< Rotate Left Digit >

Operation : dst1<3:0> \leftarrow dst2<7:4>, dst2<7:4> \leftarrow dst2<3:0>,
 dst2<3:0> \leftarrow dst1 <3:0>

Description : Rotates left the lower 4 bits of dst1 and the contents of dst2 in units of 4 bits

Details :

Byte	Size		Mnemonic	Code
	Word	Long word		
○	×	×	RLD	[A,] (mem)

1 | m | 0 | 0 | m | m | m | m
 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0

Flags : S Z H V N C

*	*	0	*	0	-
---	---	---	---	---	---

S = MSB value of the A register after rotate is set.

Z = 1 is set when the contents of the A register after the rotate are 0, otherwise 0.

H = Reset to 0.

V = 1 is set when the parity (number of 1s) of the A register is even after the rotate, otherwise 0.

N = Reset to 0.

C = No change

Execution example: RLD A,(100H)

When the A register = 12H and the contents of memory at address 100H = 34H, execution sets the A register to 13H and the contents of memory at address 100H to 42H.

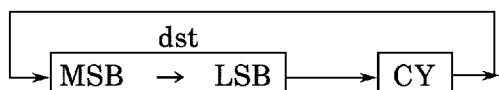

RR num, dst

< Rotate Right >

Operation : {CY & dst ← right rotates the value of CY & dst} Repeat num

Description : Rotates right the linked contents of the carry flag and dst.
Repeats the number of times specified in num.

Description figure:

Details :

S = MSB value of the result is set.

Z = 1 is set when the result is 0, otherwise 0.

H = 1 is set when a borrow from bit 3 to bit 4 occurs as a result, otherwise 0.
When the operand is 32 bits, an undefined value is set.

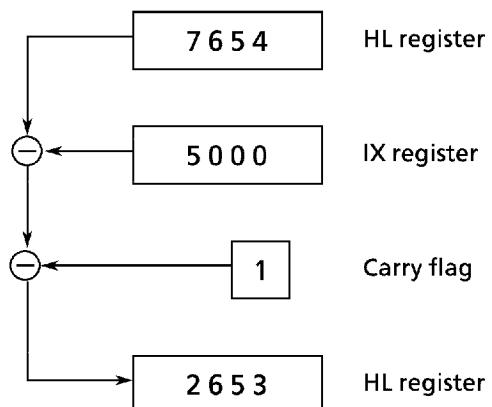

V = 1 is set when an overflow occurs as a result, otherwise 0.

N = 1 is set.

C = 1 is set when a borrow from the MSB occurs as a result, otherwise 0.

Execution example: SBC HL, IX

When the HL register is 7654H, the IX register = 5000H, and the carry flag = 1, execution sets the HL register to 2653H.

SCC condition, dst

< Set Condition Code >

Operation : If cc is true, then dst $\leftarrow 1$ else dst $\leftarrow 0$.

Description : Loads 1 to dst when the operand condition is true; when false, 0 is loaded to dst.

Details :

1	m	0	z	m	m	m	m																					
0	1	1	1	1	1	1	1																					

Note : When the number of shifts, num, is specified by the A register, the value of the lower 4 bits of the A register is used. Specifying 0 shifts 16 times. When dst is memory, shifting is performed only once.

Flags : S Z H V N C

*	*	0	*	0	*
---	---	---	---	---	---

S = MSB value of dst after shift is set.

Z = 1 is set when the contents of dst after shift is 0, otherwise 0.

H = Reset to 0.

V = 1 is set when the parity (number of 1s) of dst is even after shift, otherwise 0.
If the operand is 32 bits, an undefined value is set.

N = Reset to 0.

C = LSB value of dst before the last shift is set.

Execution example: SRL 4, HL

When the HL register = 1238H, execution sets the HL register to 0123H and the carry flag to 1.

STCF num, dst

< Store Carry Flag >

Operation : dst<num>←CY

Description : Loads the contents of the carry flag to bit num of dst.

Details :

Byte	Size		Mnemonic	Code
	Word	Long word		
○	○	×	STCF	#4, r
○	○	×	STCF	A, r
○	×	×	STCF	#3, (mem)
○	×	×	STCF	A, (mem)

Note : When bit num is specified by the A register, the value of the lower 4 bits of the A register is used. When the operand is a byte and the value of the lower 4 bits of bit num is from 8 to 15, the operand value does not change.

Flags : S Z H V N C

-	-	-	-	-	-
---	---	---	---	---	---

S = No change

Z = No change

H = No change

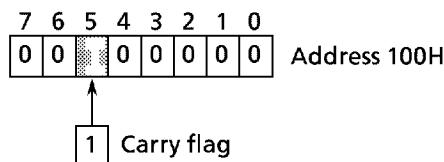

V = No change

N = No change

C = No change

Execution example: STCF 5,(100H)

When the contents of memory at address 100H = 00H and the carry flag = 1, execution sets the contents of memory at address 100H to 00100000B (binary).

SUB dst, src

< Subtract >

Operation : $dst \leftarrow dst - src$

Description : Subtracts the contents of src from those of dst and loads the result to dst.

Details :

Byte	Word	Size	Mnemonic	Code																																				
Long word																																								
○	○	○	SUB R, r	<table border="1"> <tr><td>1</td><td>1</td><td>z</td><td>z</td><td>1</td><td>r</td></tr> <tr><td>1</td><td>0</td><td>1</td><td>0</td><td>0</td><td>R</td></tr> </table>	1	1	z	z	1	r	1	0	1	0	0	R

#<7:0>																																								
#<15:8>																																								

Flags : S Z H V N C

*	*	*	*	1	*
---	---	---	---	---	---

S = MSB value of the result is set.

Z = 1 is set when the result is 0, otherwise 0.

H = 1 is set when a borrow from bit 3 to bit 4 occurs as a result, otherwise 0.
When the operand is 32 bits, an undefined value is set.

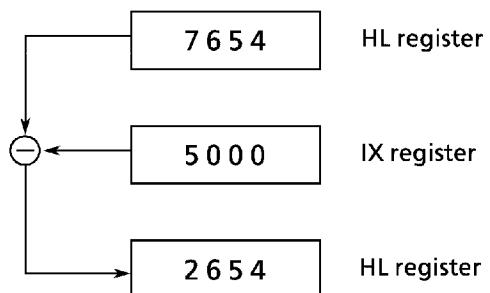

V = 1 is set when an overflow occurs as a result, otherwise 0.

N = 1 is set.

C = 1 is set when a borrow from MSB occurs as a result, otherwise 0.

Execution example: SUB HL, IX

When the HL register = 7654H and the IX register = 5000H,
execution sets the HL register to 2654H.

SWI num

< Software Interrupt >

Operation : 1) XSP \leftarrow XSP-6

2) (XSP) \leftarrow SR

3) (XSP+2) \leftarrow 32 bit PC

4) PC \leftarrow (Address refer to vector + num \times 4)

Note : Address refer to vector is defined for each product.

Description : Saves to the stack area the contents of the status register and contents of the program counter which indicate the address next to the SWI instruction. Finally, jumps to vector is indicated address refer to vector.

Details :

Mnemonic

Code

SWI	[#3]	<table border="1" style="border-collapse: collapse; width: 100%;"> <tr> <td style="width: 25%;">1</td> <td style="width: 25%;">1</td> <td style="width: 25%;">1</td> <td style="width: 25%;">1</td> </tr> <tr> <td>#3</td> <td></td> <td></td> <td></td> </tr> </table>	1	1	1	1	#3			
1	1	1	1							
#3										

Note 1 : A value from 0 to 7 can be specified as the operand value. When the operand coding is omitted, SWI 7 is assumed.

Note 2 : The status register structure is as shown below.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SYSM	IFF2	IFF1	IFF0	MAX	RFP2	RFP1	RFP0	S	Z	"0"	H	"0"	V	N	C

Flags : S Z H V N C

-	-	-	-	-	-
---	---	---	---	---	---

S = No change

Z = No change

H = No change

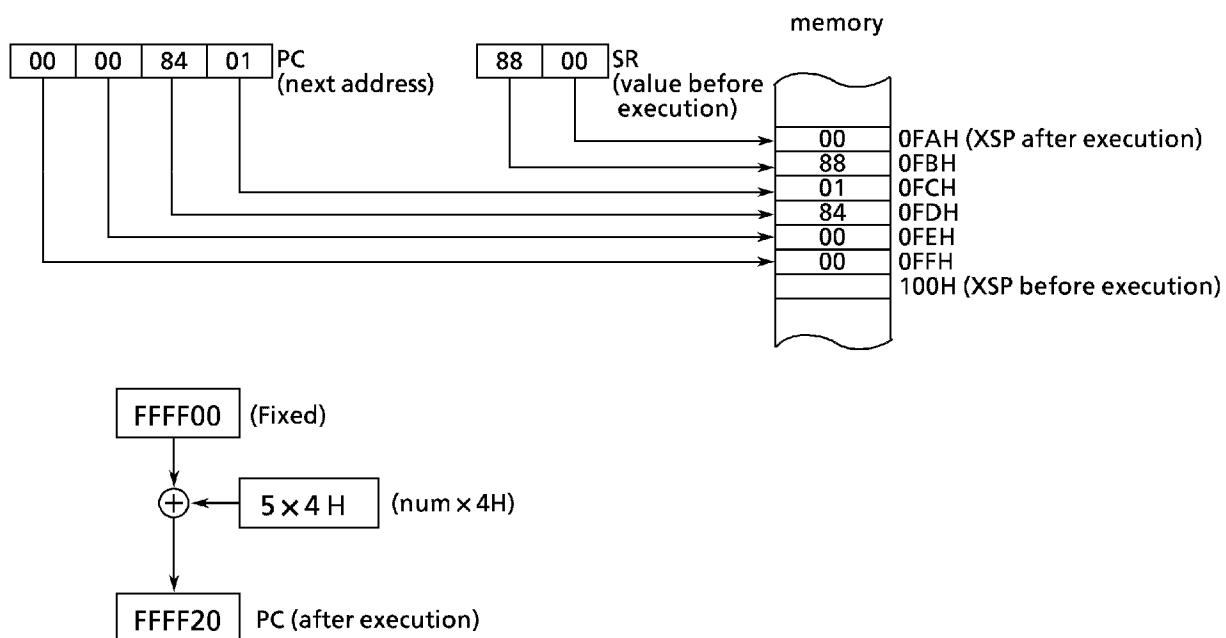

V = No change

N = No change

C = No change

Execution example: SWI 5

When the stack pointer XSP = 100H, the status register = 8800H, executing the above instruction at memory address 8400H writes the contents of the previous status register 8800H in memory address 00FAH, and the contents of the program counter 00008401H in memory address 00FCH, then jumps to address FFFF20H.

TSET num, dst

< Test and Set >

Operation : Z flag \leftarrow inverted value of dst <num>
dst <num> \leftarrow 1

Description : Loads the inverted value of the bit num of dst to the Z flag.
Then the bit num of dst is set to “1”.

Details :

byte	word	long word	Mnemonic		Code																								
			Size																										
○	○	×	TSET	#4, r	<table border="1"> <tr><td>1</td><td>1</td><td>z</td><td>z</td><td>1</td><td></td><td>r</td><td></td></tr> <tr><td>0</td><td>0</td><td>1</td><td>1</td><td>0</td><td>1</td><td>0</td><td>0</td></tr> <tr><td>0</td><td>0</td><td>0</td><td>0</td><td></td><td>#</td><td>4</td><td></td></tr> </table>	1	1	z	z	1		r		0	0	1	1	0	1	0	0	0	0	0	0		#	4

0	0	1	1	0	1	0	0																						
0	0	0	0		#	4																							
○	×	×	TSET	#3, (mem)	<table border="1"> <tr><td>1</td><td>m</td><td>1</td><td>1</td><td>m</td><td>m</td><td>m</td><td>m</td></tr> <tr><td>1</td><td>0</td><td>1</td><td>0</td><td>1</td><td></td><td>#</td><td>3</td></tr> </table>	1	m	1	1	m	m	m	m	1	0	1	0	1		#	3								
1	m	1	1	m	m	m	m																						
1	0	1	0	1		#	3																						

Flags : S Z H V N C

X	*	1	X	0	-
---	---	---	---	---	---

- S = An undefined value is set.
- Z = The inverted value of the src <num> is set.
- H = Set to 1
- V = An undefined value is set.
- N = Set to 0
- C = No change

Execution example: When the contents of memory at address 100H=00100000B (binary), TSET 3,(100H) execution sets the Z flag to 1, the contents of memory at address 100H=00101000B (binary).

7	6	5	4	3	2	1	0
0	0	1	0	0	0	0	0
address 100H (before execution)							
Inverted				1	Z flag		
0	0	1	0	1	0	0	0
address 100H (after execution)							

UNLK dst

< Unlink >

Operation : XSP ← dst, dst ← (XSP +)

Description : Loads the contents of dst to the stack pointer XSP, then pops long word data from the stack area to dst. Used paired with the Link instruction.

Details :

Byte	Size		Mnemonic	Code
	Word	Long word		
X	X	○	UNLK	r 1 1 1 0 1 r 0 0 0 0 1 1 0 1

Flags : S Z H V N C

-	-	-	-	-	-
---	---	---	---	---	---

S = No change

Z = No change

H = No change

V = No change

N = No change

C = No change

Execution example: UNLK XIZ

As a result of executing this instruction after executing the Link instruction, the stack pointer XSP and the XIZ register revert to the same values they had before the Link instruction was executed. (For details of the Link instruction, see page 100)

XOR dst, src

< Exclusive OR >

Operation : dst←dst XOR src

Description : Exclusive ors the contents of dst with those of src and loads the result to dst.

(Truth table)

A	B	A XOR B
0	0	0
0	1	1
1	0	1
1	1	0

#<7:0>																																							
#<15:8>																																							

Flags : S Z H V N C

*	*	0	*	0	0
---	---	---	---	---	---

- S = MSB value of the result is set.
- Z = 1 is set when the result is 0, otherwise 0.
- H = Reset to 0.
- V = 1 is set when the parity (number of 1s) of dst is even as a result, otherwise 0.
If the operand is 32 bits, an undefined value is set.
- N = Cleared to 0.
- C = Cleared to 0.

Execution example: XOR HL, IX

When the HL register = 7350H and the IX register = 3456H,
execution sets the HL register to 4706H.

0111	0011	0101	0000	←	HL register (before execution)
<u>XOR)</u>	<u>0011</u>	<u>0100</u>	<u>0101</u>	<u>0110</u>	← IX register (before execution)
	0100	0111	0000	0110	← HL register (after execution)

XORCF num, src

< Exclusive OR Carry Flag >

Operation : CY \leftarrow CY XOR src<num>

Description : Exclusive ors the contents of the carry flag and bit num of src, and loads the result to the carry flag.

Details :

Byte	Size		Mnemonic	Code
	Word	Long word		
○	○	×	XORCF	#4, r
○	○	×	XORCF	A, r
○	×	×	XORCF	#3, (mem)
○	×	×	XORCF	A, (mem)

Note : When bit num is specified by the A register, the value of the lower 4 bits of the A register is used. When the operand is a byte and the value of the lower 4 bits of bit num is from 8 to 15, the result is undefined.

Flags : S Z H V N C

-	-	-	-	-	*
---	---	---	---	---	---

S = No change

Z = No change

H = No change

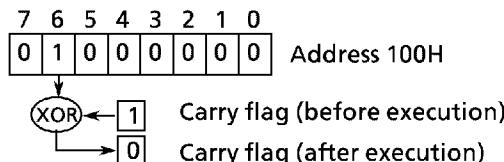

V = No change

N = No change

C = The value obtained by exclusive or-ing the contents of the carry flag with those of bit num of src is set.

Execution example: XORCF 6,(100H)

When the contents of memory at address 100H = 01000000B (binary) and the carry flag = 1, execution sets the carry flag to 0.

ZCF

< Zero flag to Carry Flag >

Operation : CY \leftarrow inverted value of Z flag

Description : Loads the inverted value of the Z flag to the carry flag.

Details :

Mnemonic

Code

ZCF

0 | 0 | 0 | 1 | 0 | 0 | 1 | 1

Flags : S Z H V N C
 - - x - 0 *

S = No change

Z = No change

H = An undefined value is set.

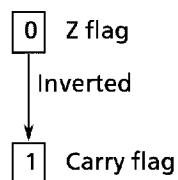

V = No change

N = Reset to 0.

C = The inverted value of the Z flag is set.

Execution example: ZCF

When the Z flag = 0, execution sets the carry flag to 1.

Appendix B Instruction Lists

■ Explanation of symbols used in this document

1. Size

B	The operand size is in bytes (8 bits)
W	The operand size is in word (16 bits)
L	The operand size is in long word (32 bits)

2. Mnemonic

R	Eight general-purpose registers including 8/16/32-bit current bank registers. 8 bit register: W, A, B, C, D, E, H, L 16 bit register: WA, BC, DE, HL, IX, IY, IZ, SP 32 bit register: XWA, XBC, XDE, XHL, XIX, XIY, XIZ, XSP
r	8/16/32-bit general-purpose registers
cr	All 8/16/32-bit CPU control registers DMAS0 to 3, DMAD0 to 3, DMAC0 to 3, DMAM0 to 3, INTNEST
A	A register (8 bits)
F	Flag registers (8 bits)
F'	Inverse flag registers (8 bits)
SR	Status registers (16 bits)
PC	Program Counter (in minimum mode, 16 bits; in maximum mode, 32 bits)
(mem)	8/16/32-bit memory data
mem	Effective address value
<W>	When the operand size is a word, "W" must be specified.
[]	Operands enclosed in square brackets can be omitted.
#	8/16/32-bit immediate data.
#3	3-bit immediate data: 0 to 7 or 1 to 8 for abbreviated codes.
#4	4-bit immediate data: 0 to 15 or 1 to 16
d8	8-bit displacement: -80H to +7FH
d16	16-bit displacement: -8000H to +7FFFH
cc	Condition code
(#8)	Direct addressing : (00H) to (OFFH) ... 256-byte area
(#16)	64K-byte area addressing : (0000H) to (0FFFFH)
\$	A start address of the instruction is located

3. Cord

Z	The code represent the operand sizes. byte (8-bit) = 0 word (16-bit) = 2 long word (32-bit) = 4
ZZ	The code represent the operand sizes. byte (8-bit) = 00H word (16-bit) = 10H long word (32-bit) = 20H

4. Flag (SZHVNC)

-	Flag doesn't change.
*	Flag changes by executing instruction.
0	Flag is cleared to "0".
1	Flag is set to "1".
P	Flag changes by executing instruction (It works as parity flag).
V	Flag changes by executing instruction (It works as overflow flag).
X	An undefined value is set in flag.

5. Instruction length

Instruction length is represented in byte unit.

+#	adds immediate data length.
+M	adds addressing code length.
+#M	adds immediate data length and addressing code length.

6. State

Execution processing time of instruction are shown in order of 8 bit, 16 bit, 32 bit processing in status unit.

1 state = 100 ns at 20 MHz oscillation

1 state = 80 ns at 25 MHz oscillation

CPxx	BW-	CPIR [A/WA,(R+)]	80+zz+R :15	repeat A/WA - (R+) BC \leftarrow BC-1 until A/WA=(R) or BC=0	*②*①1-	2	6n+1
	BW-	CPD [A/WA,(R-)]	80+zz+R :16	A/WA - (R-) BC \leftarrow BC-1	*②*①1-	2	6. 6. -
	BW-	CPDR [A/WA,(R-)]	80+zz+R :17	repeat A/WA - (R-) BC \leftarrow BC-1 until A/WA=(R) or BC=0	*②*①1-	2	6n+1

Note 1: ① ; If BC=0 after execution, the P/V flag is set to 0, otherwise 1.

② ; If A/WA=(R), the Z flag is set to 1, otherwise, 0 is set.

Note 2: When the operand is omitted in the CPI, CPIR, CPD, or CPDR instruction, A, (XHL+/-) is used as the default value.

Note: Operand RR of the MUL, MULS, DIV, and DIVS instructions indicates that a register twice the size of the operation is specified. When the operation is in bytes (8 bits \times 8 bits, 16/8 bits), word register (16 bits) is specified; when the operation is in words (16 bits \times 16 bits, 32/16 bits), long word register (32 bits) is specified.

Appendix D Differences between TLCS-90 and TLCS-900 Series

Item	Series	TLCS-90	TLCS-900																
CPU architecture		8-bit CPU	16-bit CPU																
Built-in ROM/built-in RAM		8-bit data bus	16-bit data bus																
Built-in I/O		8-bit data bus	<u>8-bit</u> data bus																
External data bus		8-bit data bus	8-bit/16-bit data bus (can be mixed)																
Program space (except devices with MMU)		64 KB	16MB (linear)																
Data space		16MB (bank)	16MB (linear)																
Instruction set/instruction mnemonic		TLCS-90	TLCS-90 + α α = enhancement of 16-bit multiply / divide instructions and bit operation instruction. 32-bit load/operation instructions, C compiler instructions, register bank operation instructions, etc.																
Instruction code (object code)		Unique to TLCS-90	Unique to TLCS-900 (Different from TLCS-90.)																
Addressing mode		TLCS-90	TLCS-90 + α α = (- Reg), (Reg +), (Reg + disp16), (Reg + Reg16), (nnn)																
General-purpose register		TLCS-90	TLCS-90 + α α = Uses as 32 bits and register bank, and adds a system stack pointer.																
Flag (F)		<table border="1"><tr><td>S</td><td>Z</td><td>I</td><td>H</td><td>X</td><td>V</td><td>N</td><td>C</td></tr></table>	S	Z	I	H	X	V	N	C	<table border="1"><tr><td>S</td><td>Z</td><td>"0"</td><td>H</td><td>"0"</td><td>V</td><td>N</td><td>C</td></tr></table> I flag is extended to IFF2 to 0 of status register.X flag is deleted.	S	Z	"0"	H	"0"	V	N	C
S	Z	I	H	X	V	N	C												
S	Z	"0"	H	"0"	V	N	C												
Reset		PC ← 0000H (SP does not change.)	PC ← (Vector base address) XSP ← 100H																
Built-in ROM address Built-in RAM address Built-in I/O address Direct addressing area (n)		0000H to to FFxxH FFxxH~FFFFH FF00H~FFFFH	undefined 0080H to 0000H~007FH 0000H~00FFH																
Interrupt Interrupt start address Register to be saved Mask register Mask level		0000H + (8 × V) PC & AF IFF 0~1	Vector base address + 4 × V PC & SR IFF2~0 0~7																

Item	Series	TLCS-90	TLCS-900
Instruction			
① ADD R, r (word type)		<p>S/Z/V flags don't change.</p> <p>S/Z/V flag changes expect add 16 bit register.</p>	<p>S/Z/V flag changes.</p>
② Shift of A register		<p>RLCA RRCA RLA RRA SLAA SRAA SLLA SRLA</p> <p>S/Z/V flags don't change in these instruction.</p> <p>RLC A RRC A RL A RR A SLA A SRA A SLL A SRL A</p> <p>S/Z/V flag changes in these instruction.</p>	<p>S/Z/V flag changes.</p>

Note : The TLCS-900 series is essentially the same as the TLCS-90 series but with a 16-bit CPU. Built-in I/Os are completely compatible with those of the TLCS-90.

However, six types of instructions used in the TLCS-90 series do not directly correspond with those used in the TLCS-900 series. Thus, when transferring programs designed for the TLCS-90 to the TLCS-900, replace them with equivalents as follows:

Instructions in TLCS-90 but not in TLCS-900	Equivalent instructions in TLCS-900
EXX	EX BC, BC' EX DE, DE' EX HL, HL'
EX AF, AF'	EX A, A' EX F, F'
PUSH AF	PUSH A PUSH F
POP AF	POP F POP A
INCX	(32-bit INC instruction)
DECX	(32-bit DEC instruction)

Some TLCS-900 series instructions, though basically the same as TLCS-90 instructions, have more functions and more specification items in their operands. They are listed below.

TLCS-90	TLCS-900
INC reg	INC imm3, reg
INC mem	INC imm3, mem
DEC reg	DEC imm3, reg
DEC mem	DEC imm3, mem
RLC reg	RLC imm, reg
RRC reg	RRC imm, reg
RL reg	RL imm, reg
RR reg	RR imm, reg
SLA reg	SLA imm, reg
SRA reg	SRA imm, reg
SLL reg	SLL imm, reg
SRL reg	SRL imm, reg
